

Level-k Reasoning

多層次思考

Joseph Tao-yi Wang (王道一)
Lecture 8, EE-BGT

Outline

- ▶ Introduction: Initial Deviations from MSE
 - ▶ Hide-and-Seek: Crawford & Iriberry (AER07)
 - ▶ Initial Joker Effect: Re-assess O'Neil (1987)
- ▶ Simultaneous Dominant Solvable Games
 - ▶ Price competition: Capra et al (IER 2002)
 - ▶ Traveler's dilemma: Capra et al (AER 1999)
 - ▶ p-BC game: Nagel (AER 95), CHW (AER 98)
- ▶ Level-k Theory:
 - ▶ Stahl-Wilson (GEB1995), CGCB (ECMA2001)
 - ▶ Costa-Gomes & Crawford (AER 2006)

Special **Hide-and-Seek** Games

- ▶ **RTH**: Rubinstein & Tversky (1993); Rubinstein, Tversky, & Heller (1996); Rubinstein (1998,1999)
- ▶ Your opponent has hidden a prize in one of four boxes arranged in a row.
- ▶ The boxes are marked as shown below: A, B, A, A. (Non-neutral Location Framing!)

A

B

A

A

Special Hide-and-Seek Games

- ▶ RTH (Continued):
- ▶ Your goal is, of course, to find the prize.
- ▶ His goal is that you will not find it.
- ▶ You are allowed to open only one box.
- ▶ Which box are you going to open?

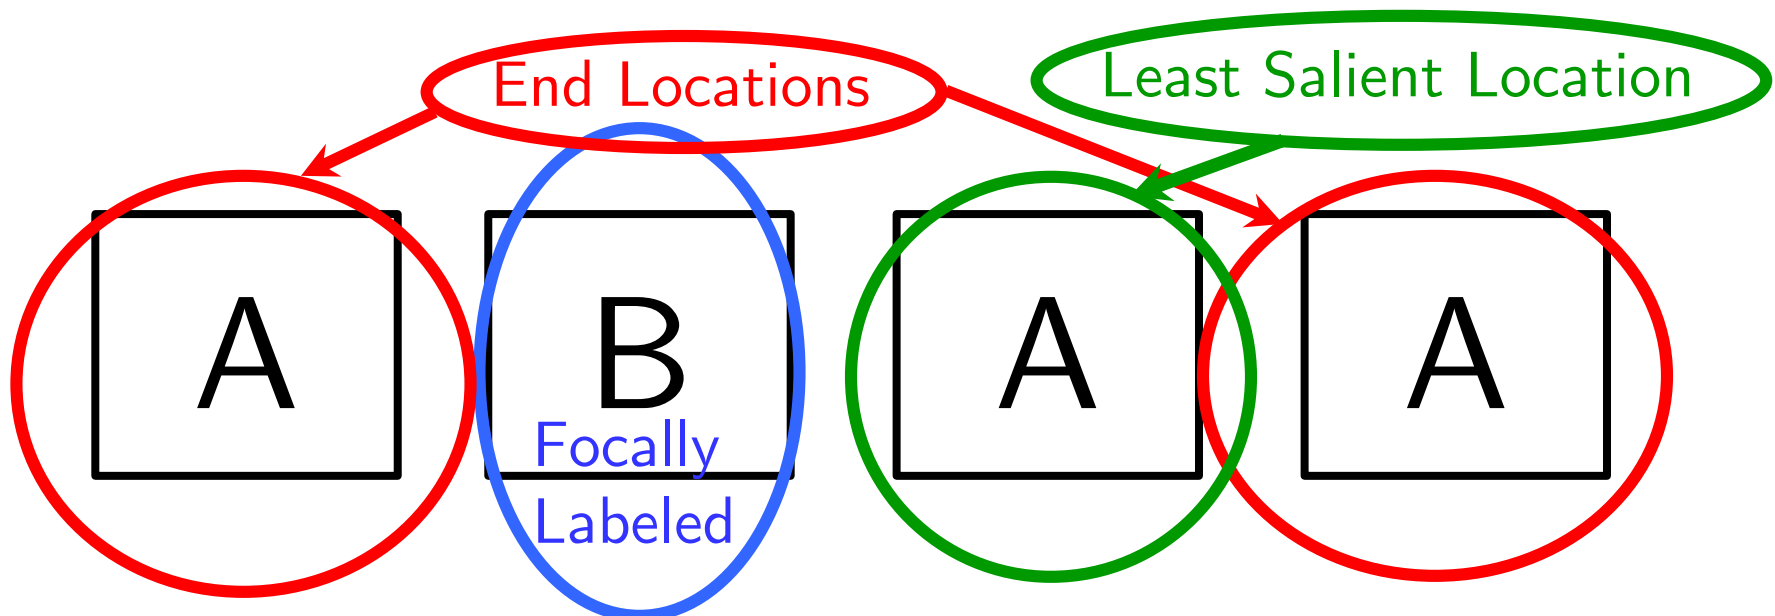

Special **Hide-and-Seek** Games

- ▶ Folk Theory: "...in Lake Wobegon, **the correct answer is usually 'c'.**"
 - ▶ Garrison Keillor (1997) on multiple-choice tests
- ▶ Comment on the poisoning of the Ukrainian presidential candidate (later president):
 - ▶ "Any government wanting to kill an opponent ...**would not try** it at a meeting with government officials."
 - ▶ Viktor Yushchenko, quoted in Chivers (2004)

Special Hide-and-Seek Games

- ▶ **B** is distinguished by its label
- ▶ The two **end A** may be inherently salient
 - ▶ This gives the **central A** location its own brand of uniqueness as the **least salient** location

Special Hide-and-Seek Games

- ▶ RTH's game has a unique equilibrium, in which **both players randomize uniformly**
- ▶ Expected payoffs: **Hider $3/4$, Seeker $1/4$**

| Hider/Seeker | A | B | A | A |
|--------------|------|------|------|------|
| A | 0, 1 | 1, 0 | 1, 0 | 1, 0 |
| B | 1, 0 | 0, 1 | 1, 0 | 1, 0 |
| A | 1, 0 | 1, 0 | 0, 1 | 1, 0 |
| A | 1, 0 | 1, 0 | 1, 0 | 0, 1 |

Special **Hide-and-Seek** Games

- ▶ All Treatments in RTH:
 - ▶ Baseline: ABAA (Treasure Treatment)
- ▶ Variants:
 - ▶ Left-Right Reverse: AABA
 - ▶ Labeling: 1234 (2 is like B, 3 is like central A)
- ▶ Mine Treatments
 - ▶ Hider hides a mine in 1 location, and Seeker wants to avoid the mine (payoffs reversed)
 - ▶ mine hidere = seekers, mine seekers = hidere

Hide-and-Seek Games: RTH Results

Player roles reversed

| RTH-4 | A | B | A | A |
|------------------|-----|-----|-----|-----|
| Hider (53) | 9% | 36% | 40% | 15% |
| Seeker (62) | 13% | 31% | 45% | 11% |
| RT-AABA-Treasure | A | A | B | A |
| Hider (189) | 22% | 35% | 19% | 25% |
| Seeker (85) | 13% | 51% | 21% | 15% |
| RT-AABA-Mine | A | A | B | A |
| Hider (132) | 24% | 39% | 18% | 18% |
| Seeker (73) | 29% | 36% | 14% | 22% |
| RT-1234-Treasure | 1 | 2 | 3 | 4 |
| Hider (187) | 25% | 22% | 36% | 18% |
| Seeker (84) | 20% | 18% | 48% | 14% |
| RT-1234-Mine | 1 | 2 | 3 | 4 |
| Hider (133) | 18% | 20% | 44% | 17% |
| Seeker (72) | 19% | 25% | 36% | 19% |
| R-ABAA | A | B | A | A |
| Hider (50) | 16% | 18% | 44% | 22% |
| Seeker (64) | 16% | 19% | 54% | 11% |

Different locations for B

2 analogous to B

Hide-and-Seek Games: RTH Results

| | | | | |
|------------------|-----|-----|-----|-----|
| RTH-4 | A | B | A | A |
| Hider (53) | 9% | 36% | 40% | 15% |
| Seeker (62) | 13% | 31% | 45% | 11% |
| RT-AABA-Treasure | A | A | B | A |
| Hider (189) | 22% | 35% | 19% | 25% |
| Seeker (85) | 13% | 51% | 21% | 15% |
| RT-AABA-Mine | A | A | B | A |
| Hider (132) | 24% | 39% | 18% | 18% |
| Seeker (73) | 29% | 36% | 14% | 22% |
| RT-1234-Treasure | 1 | 2 | 3 | 4 |
| Hider (187) | 25% | 22% | 36% | 18% |
| Seeker (84) | 20% | 18% | 48% | 14% |
| RT-1234-Mine | 1 | 2 | 3 | 4 |
| Hider (133) | 18% | 20% | 44% | 17% |
| Seeker (72) | 19% | 25% | 36% | 19% |
| R-ABAA | A | B | A | A |
| Hider (50) | 16% | 18% | 44% | 22% |
| Seeker (64) | 16% | 19% | 54% | 11% |

Stylized facts

Hide-and-Seek Games: RTH Results

- ▶ Can pool data since no significant differences for Seekers ($p = 0.48$) or Hiders ($p = 0.16$)
- ▶ Chi-square Test across 6 different Treatments

| Role | A | B | A | A |
|--------------------|--------|--------|--------|--------|
| Hiders (n=624) | 21.63% | 21.15% | 36.54% | 20.67% |
| Seekers (n=560) | 18.21% | 20.54% | 45.89% | 15.36% |

Hide-and-Seek Games: Stylized Facts

- ▶ **Central A** (or 3) is **most prevalent** for both Hiders and Seekers
- ▶ **Central A** is **even more prevalent** for Seekers (or Hiders in Mine treatments)
 - ▶ Hence, Seekers do better than in equilibrium!
- ▶ Shouldn't Hiders realize that Seekers will be **just as tempted** to look there?
 - ▶ RTH: "The finding that both choosers and guessers selected the least salient alternative suggests **little or no strategic thinking.**"

Hide-and-Seek Games: Stylized Facts

- ▶ Can a strategic theory explain this?
 - ▶ Heterogeneous population with substantial frequencies of L2 and L3 as well as L1 (estimated 19% L1, 32% L2, 24% L3, 25% L4) can reproduce the stylized facts
- ▶ More on Level-k later...
 - ▶ Let us first see more evidence in DS Games...

Simultaneous Dominant Solvable Games

- ▶ Initial Response vs. Equilibration
- ▶ Price Competition
 - ▶ Capra, Goeree, Gomez and Holt (IER 2002)
- ▶ Traveler's Dilemma
 - ▶ Capra, Goeree, Gomez and Holt (AER 1999)
- ▶ p -Beauty Contest
 - ▶ Nagel (AER 1995)
 - ▶ Camerer, Ho, Weigelt (AER 1998)

Price Competition

- ▶ Capra, Goeree, Gomez & Holt (IER 2002)
 - ▶ Two firms pick prices p_1 & p_2 from \$0.60-\$1.60
 - ▶ Both get $(1 + \alpha)^* p_1 / 2$ if tied
- ▶ But if $p_1 < p_2$:
 - ▶ Low-price firm gets $(1 \times p_1)$
 - ▶ Other firm gets $(\alpha \times p_1)$
- ▶ α = responsiveness to best price (=0.2/0.8)
 - ▶ $\alpha \rightarrow 1$: Meet-or-release (low price guarantees)
 - ▶ $\alpha < 1$: Bertrand competition predicts lowest price

Price Competition: Data

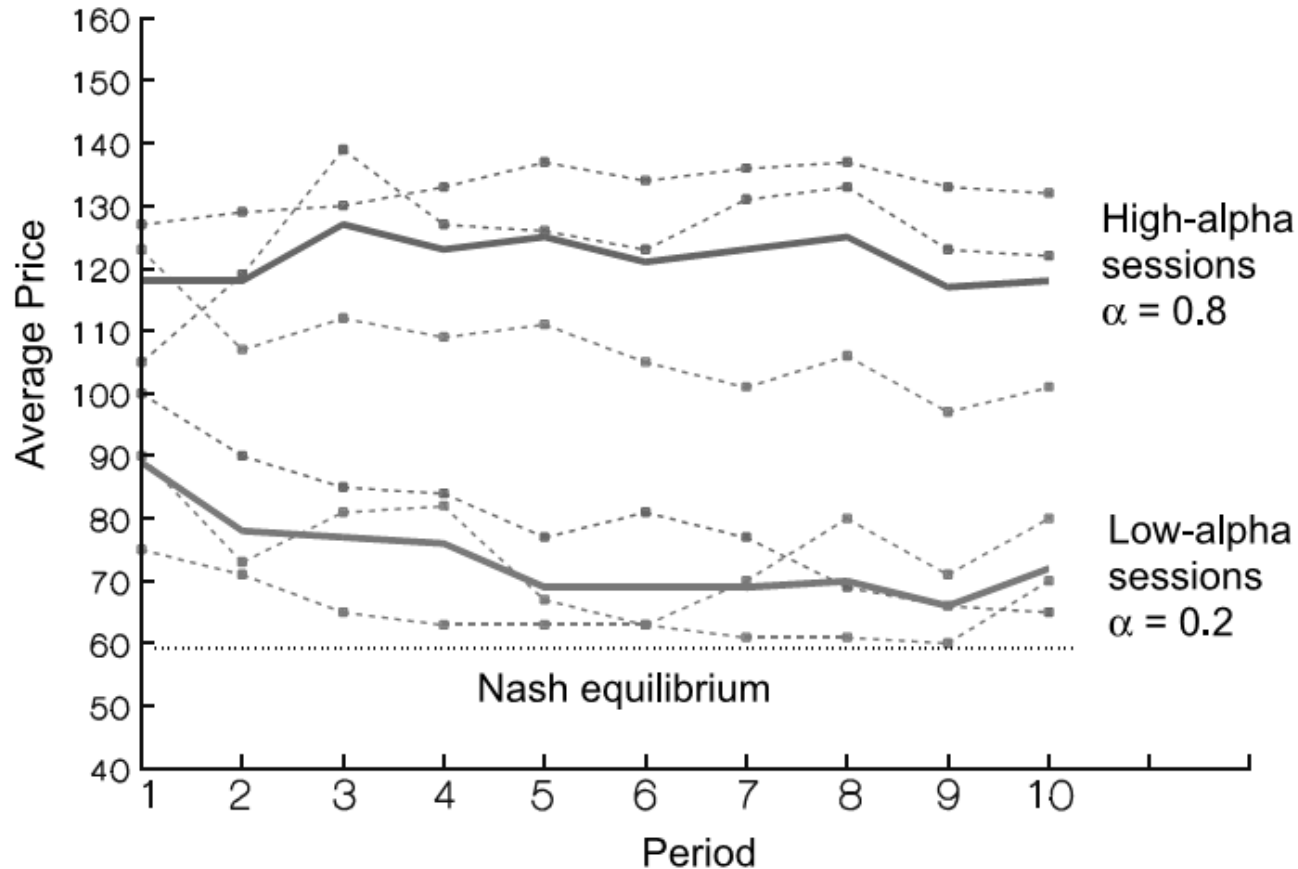

FIGURE 5

AVERAGE PRICES BY SESSION (DASHED LINES) AND TREATMENT (DARK LINE)

Price Competition: Simulation

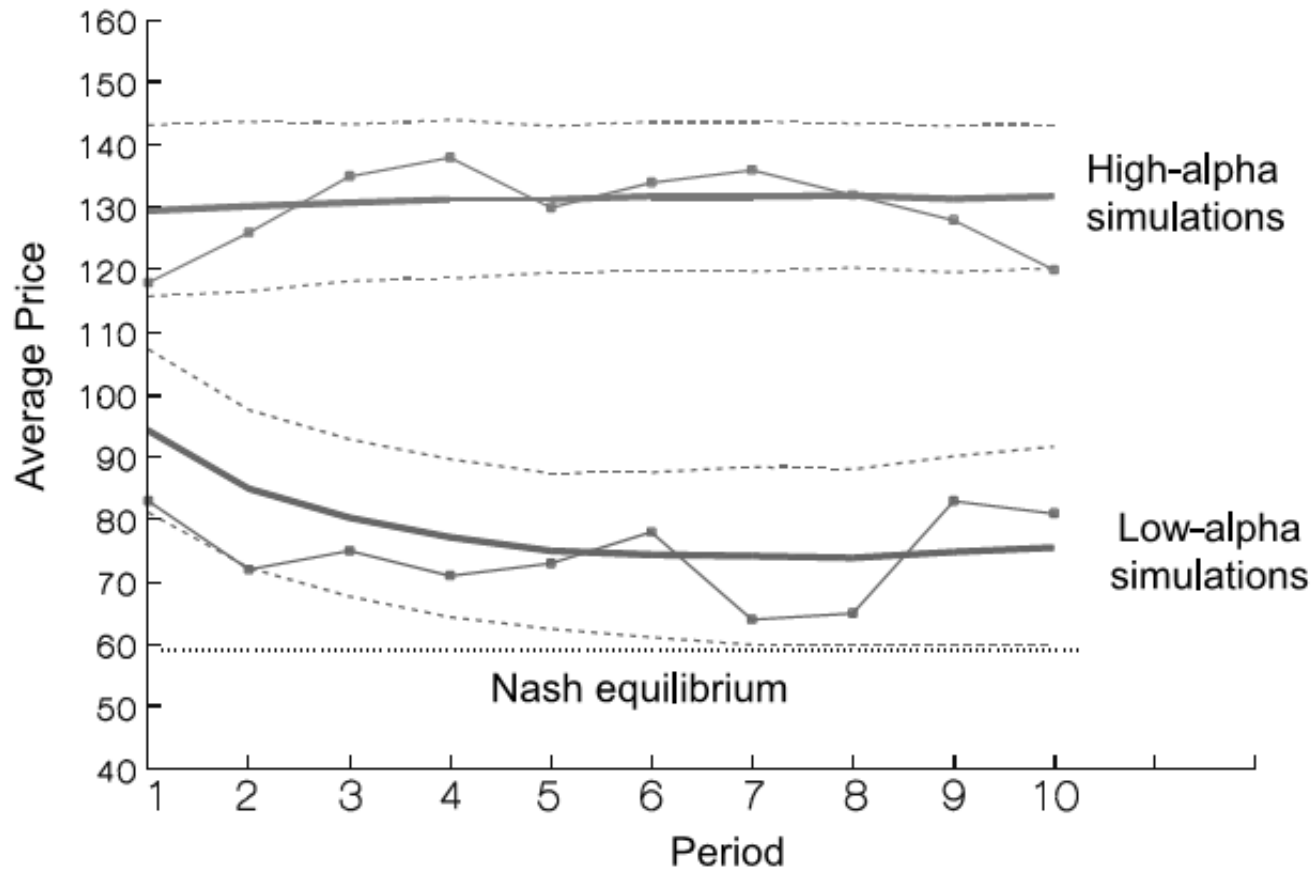

FIGURE 4

SIMULATED AVERAGE PRICES OBTAINED FROM 1000 SIMULATIONS (DARK LINES) ± 2 STANDARD DEVIATION (DOTTED LINES) AND A TYPICAL RUN (LINES CONNECTING SQUARES)

Traveler's Dilemma

- ▶ Capra, Goeree, Gomez & Holt (AER 1999)
 - ▶ Two travelers state claim p_1 and p_2 : 80-200
 - ▶ Airline awards both the **minimum claim**, but
 - ▶ **Reward** R to the one who stated the lower claim
 - ▶ **Penalize** the other by R
- ▶ **Unique NE**: race to the bottom
 - lowest claim
- ▶ Like price competition game or p -beauty contest

Traveler's Dilemma: Data

FIGURE 1. DATA FOR PART A FOR VARIOUS VALUES OF THE REWARD/PENALTY PARAMETER

p -Beauty Contest Games 選美結果預測實驗

- ▶ Each of N players choose x_i from $[0,100]$
 - ▶ 每人選擇0到100之間的數字，希望最接近「所有數字平均乘以 p 倍」
- ▶ Target is p^* (average of x_i)
- ▶ Closest x_i wins fixed prize
- ▶ $(67,100]$ violates 1st order dominance
 - ▶ 選擇67-100的人是選擇(一階的)劣勢策略
- ▶ $(45, 67]$ obeys 1 step (not 2) of dominance
 - ▶ 選擇45-67的人是選擇除去一階劣勢策略後剩下的(二階)劣勢策略
- ▶ 1st Experiment (最早的實驗): Nagel (AER 1995)

Figure 1A of Nagel (AER 1995): $p = 1/2$

Figure 1B of Nagel (AER 1995): $p = 2/3$

p -Beauty Contest Games 選美結果預測實驗

- ▶ Named after Keynes, General Theory (1936)
- ▶ "...professional investment may be likened to those newspaper competitions in which the competitors have to pick out the six prettiest faces from a hundred photographs,
(專業投資好比報紙上的選美比賽，要從上百張照片挑出最漂亮的六張)
- ▶ the prize being awarded to the competitor whose choice **most nearly corresponds to the average preferences** of the competitors as a whole..."
 - ▶ (目標是選擇最接近「平均參賽者會選到的照片」)

p -Beauty Contest Games 選美結果預測實驗

- ▶ It is not a case of choosing those [faces] that, to the best of one's judgment, are really the **prettiest**,
 - ▶ 「這不是要挑每個人各自認為最漂亮的[臉蛋],
- ▶ nor even those that **average opinion** genuinely thinks the prettiest.
 - ▶ 更不是要挑大家公認最漂亮的。
- ▶ We have reached the **third degree** where we devote our intelligences to...
 - ▶ 我們已經想到**第三層**去,

p -Beauty Contest Games 選美結果預測實驗

- ▶ Anticipating what average opinion expects the average opinion to be.
 - ▶ 努力預測一般人心目中認為大家公認最漂亮的會是誰。
- ▶ And there are some, I believe, who practice the **fourth, fifth and higher degrees.**"
 - ▶ 而且我相信有些人還可以想到第四層、第五層或更高。」
 - ▶ Keynes (凱因斯, 1936, p.156)
- ▶ Follow-up Studies (後續研究)
 - ▶ Camerer, Ho and Weigelt (AER 1998)

Camerer, Ho & Weigelt (AER 1998): Design

FIGURE 1A. A FINITE-THRESHOLD GAME, $FT(n) = ([100, 200], 1.3, n)$

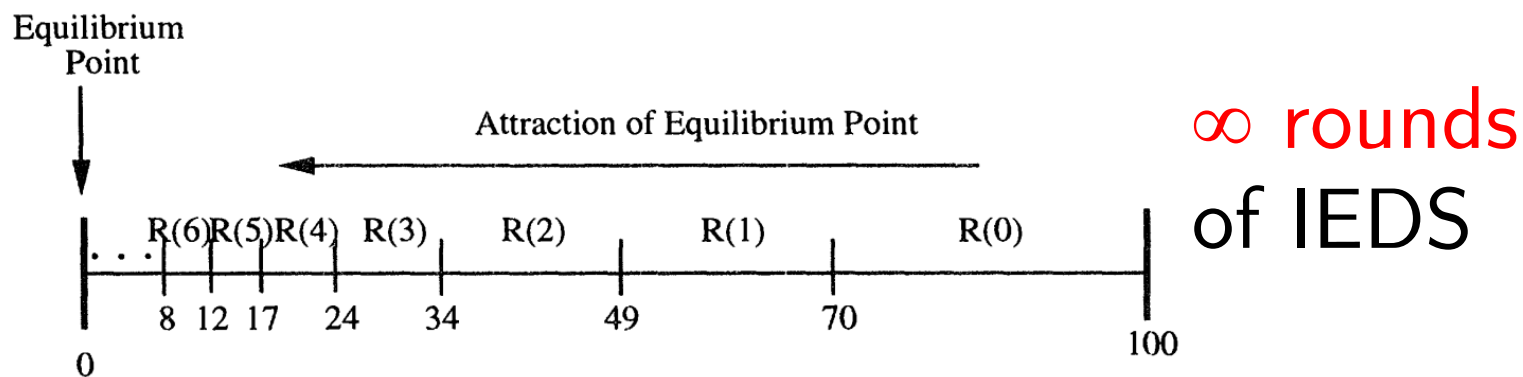

FIGURE 1B. AN INFINITE-THRESHOLD GAME, $IT(n) = ([0, 100], 0.7, n)$

Camerer, Ho & Weigelt (AER 1998): Design

TABLE 1—THE EXPERIMENTAL DESIGN

| 實驗設計 | Group size | |
|---------------------------|---|-----------------------|
| | 3 | 7 |
| 先做有限次 再做無限次 (刪劣勢策略) | Finite → Infinite | |
| | $FT(1.3, 3) \rightarrow IT(0.7, 3)$ (7 groups) | $1.3 \rightarrow 0.7$ |
| | $FT(1.1, 3) \rightarrow IT(0.9, 3)$ (7 groups) | $1.1 \rightarrow 0.9$ |
| | | |
| 先做無限次 再做有限次 | Infinite → Finite | |
| | $IT(0.7, 3) \rightarrow FT(1.3, 3)$ (7 groups) | $0.7 \rightarrow 1.3$ |
| | $IT(0.9, 3) \rightarrow FT(1.1, 3)$ (6 groups) | $0.9 \rightarrow 1.1$ |
| | | |

RESULT 1:

- ▶ First-period choices are far from equilibrium, and centered near the interval midpoint.
- ▶ Choices converge toward the equilibrium point over time.
- ▶ Baseline: IT(0.9,7) and IT(0.7, 7)

Camerer, Ho and Weigelt (AER 1998): $p=0.9$ vs. 0.7

40.5 (L2, D1)

24.5 (L2, D1)

FIGURE 2C. INEXPERIENCED SUBJECTS' CHOICES OVER ROUND IN $IT(0.9, 7)$

FIGURE 2A. INEXPERIENCED SUBJECTS' CHOICES OVER ROUND IN $IT(0.7, 7)$

45 (L1, D0)

35 (L1, D0)

" $p=0.7$ " closer to 0

Camerer, Ho and Weigelt (AER 1998)

- ▶ IT(0.9,7) vs. IT(0.7, 7)

RESULT 2:

- ▶ On average, choices are **closer to equilibrium**
 - ▶ for games with **finite thresholds**, and
 - ▶ for games with **p further from 1**.
-
- ▶ Infinite vs. Finite...

Camerer, Ho and Weigelt (1998): FT vs. IT

FIGURE 3A. CHOICES OVER ROUND IN FT GAMES PLAYED BY 3-PERSON GROUPS

FT closer to Equilibrium

FIGURE 2E. INEXPERIENCED SUBJECTS' CHOICES OVER ROUND IN IT(0.7, 3)

Camerer, Ho and Weigelt (1998): FT 3 vs. 7

FIGURE 3A. CHOICES OVER ROUND IN FT GAMES PLAYED BY 3-PERSON GROUPS

FIGURE 3B. CHOICES OVER ROUND IN FT GAMES PLAYED BY 7-PERSON GROUPS

7-group closer than 3-group

RESULT 3:

- ▶ Choices are **closer to equilibrium**
- ▶ for **large (7-person) groups** than for small (3-person) groups.

- ▶ More on 7-group vs. 3-group...

Camerer, Ho and Weigelt (1998): IT 3 vs. 7

24.5 (L2, D1)

35 (L1, D0)

$p = 0.7$

FIGURE 2E. INEXPERIENCED SUBJECTS' CHOICES OVER ROUND IN $IT(0)$

FIGURE 2A. INEXPERIENCED SUBJECTS' CHOICES OVER ROUND IN $IT(0.7, 7)$

Camerer, Ho and Weigelt (1998): IT 7 vs. 3

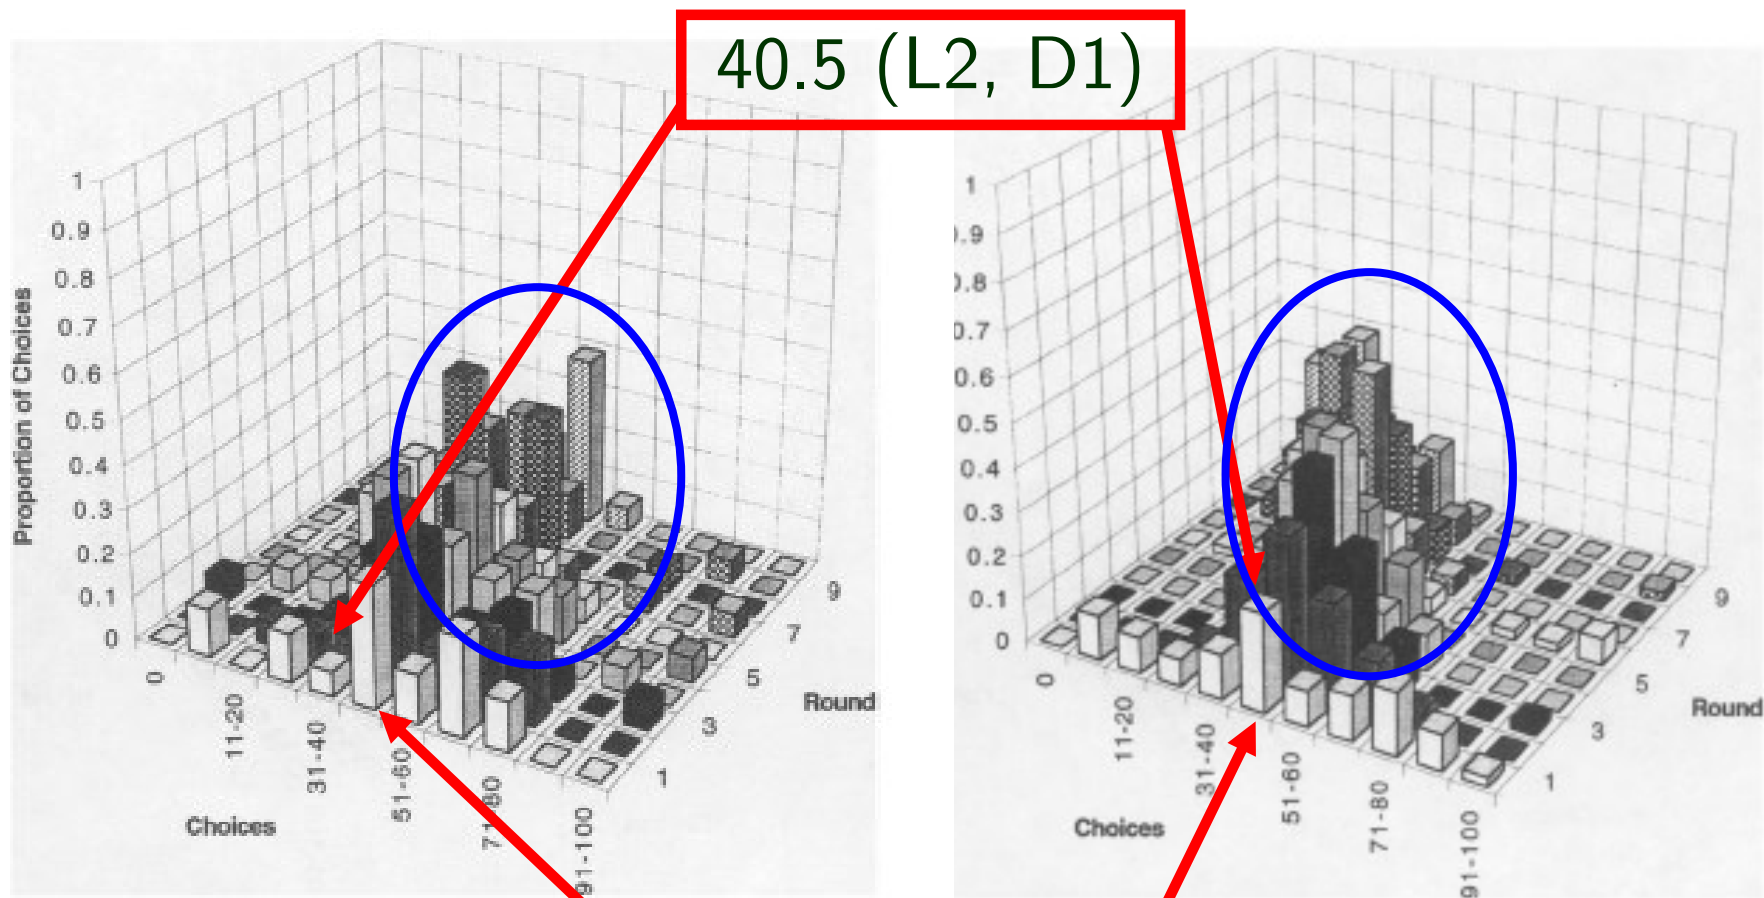

FIGURE 2G. INEXPERIENCED SUBJECTS' CHOICES OVER ROUND IN IT(0.9, 3) 2G. INEXPERIENCED SUBJECTS' CHOICES OVER ROUND IN IT(0.9, 7)

RESULT 4:

- ▶ Choices by [cross-game] **experienced subjects** are no different than choices by inexperienced subjects in the **first round**,
- ▶ but **converge faster** to equilibrium.

- ▶ Inexperienced vs. Experienced...

Camerer, Ho and Weigelt (1998): Experience

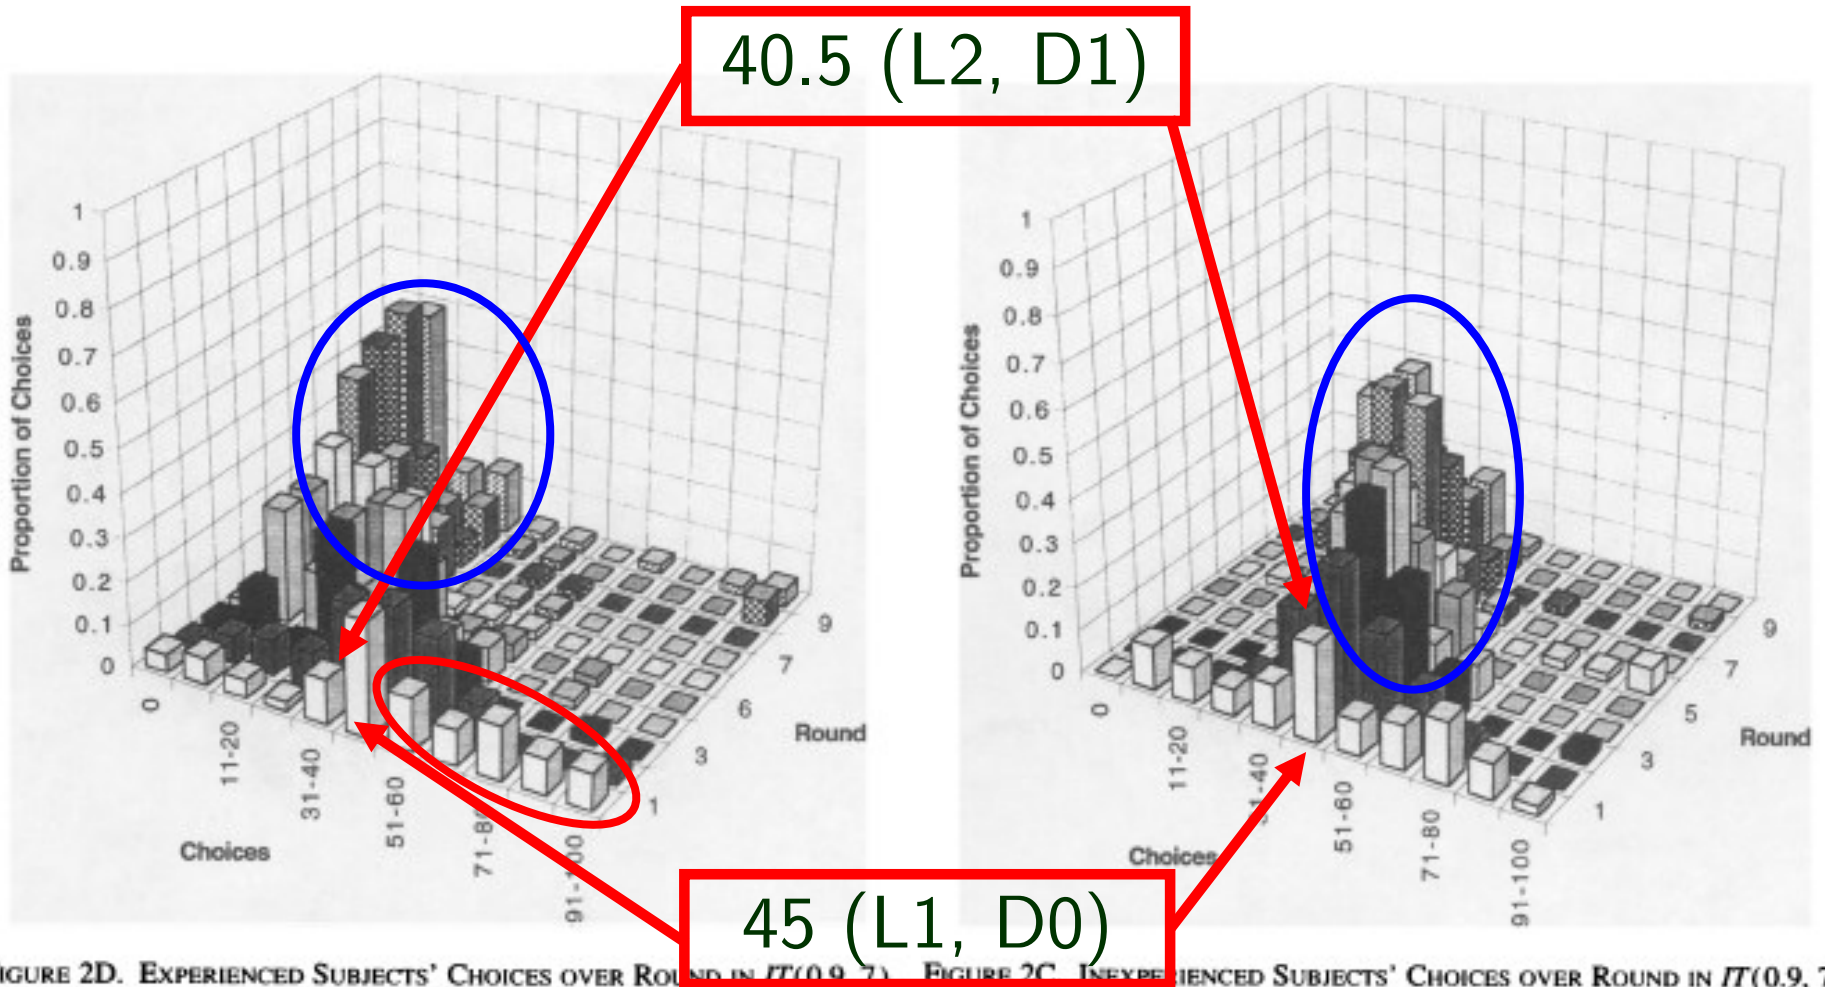

FIGURE 2B. EXPERIENCED SUBJECTS' CHOICES OVER ROUND IN $IT(0.7, 7)$

Camerer, Ho and Weigelt (AER 1998)

- ▶ Classification of Types
 - ▶ Follow Stahl and Wilson (GEB 1995)
- ▶ **Level-0**: pick randomly from $N(\mu, \sigma)$
- ▶ **Level-1**: BR to level-0 with noise
- ▶ **Level-2**: BR to level-1 with noise
- ▶ **Level-3**: BR to level-2 with noise
- ▶ Estimate type, error using MLE

Camerer, Ho and Weigelt (AER 1998)

TABLE 3—MAXIMUM-LIKELIHOOD ESTIMATES AND LOG-LIKELIHOODS FOR LEVELS OF ITERATED DOMINANCE (FIRST-ROUND DATA ONLY)

| Parameter estimates | Out data (groups of 3 or 7) | | Nagel's data (groups of 16–18) | |
|---------------------|--------------------------------|------------|-----------------------------------|---------------|
| | $IT(p, n)$ | $FT(p, n)$ | $IT(0.5, n)$ | $IT(2/3, n)$ |
| ω_0 | 15.93 | 21.72 | 45.83 (23.94) | 28.36 (13.11) |
| ω_1 | 20.74 | 31.46 | 37.50 (29.58) | 34.33 (44.26) |
| ω_2 | 13.53 | 12.73 | 16.67 (40.84) | 37.31 (39.34) |
| ω_3 | 49.50 | 34.08 | 0.00 (5.63) | 0.00 (3.28) |
| μ | 70.13 | 100.50 | 35.53 (50.00) | 52.23 (50.00) |
| σ | 28.28 | 26.89 | 22.70 | 14.72 |
| ρ | 1.00 | 1.00 | 0.24 | 1.00 |
| $-LL$ | 1128.29 | 1057.28 | 168.48 | 243.95 |

Type distribution...

Camerer, Ho and Weigelt (AER 1998)

- ▶ Robustness checks:
 - ▶ High stakes (Fig.1.3 - small effect lowering numbers)
 - ▶ Median vs. Mean (Nagel 1999 - same): BGT Fig. 5.1
 - ▶ $p^*(\text{Median}+18)$: Equilibrium is inside
- ▶ Subject Pool Variation:
 - ▶ Portfolio managers, Econ PhD, Caltech undergrads
 - ▶ Caltech Board of Trustees (CEOs)
 - ▶ Readers of Financial Times and Expansion
- ▶ Experience vs. Inexperience (for the same game)
 - ▶ Slonim (EE 2005) – Experience good only for 1st rd.

Level-k Reasoning

- ▶ **Theory for Initial Response** (BGT, Ch. 5)
vs. Theory for Equilibration (BGT, Ch. 6)
- ▶ **First:** Stahl and Wilson (GEB 1995)
- ▶ **Better:** Costa-Gomes, Crawford & Broseta
(Econometrica 2001)
- ▶ **Best 1:** Camerer, Ho and Chong (QJE 2004)
 - ▶ Poisson Cognitive Hierarchy
- ▶ **Best 2:** Costa-Gomes & Crawford (AER 2006)

Level-k Theory: Stahl & Wilson (GEB 1995)

- ▶ Stahl and Wilson (GEB 1995)
- ▶ **Level-0**: Random play
- ▶ **Level-1**: BR to Random play
- ▶ **Level-2**: BR to Level-1
- ▶ **Nash**: Play Nash Equilibrium
- ▶ **Worldly**: BR to distribution of Level-0, Level-1 and Nash types

Level-k Theory: Stahl & Wilson (GEB 1995)

TABLE IV
PARAMETER ESTIMATES AND CONFIDENCE INTERVALS FOR MIXTURE MODEL
WITHOUT RE TYPES

| | Estimate | Std. Dev. | 95 percent conf. int. | |
|---------------|----------|-----------|-----------------------|---------|
| γ_1 | 0.2177 | 0.0425 | 0.1621 | 0.3055 |
| μ_2 | 0.4611 | 0.0616 | 0.2014 | 0.8567 |
| | | | [0.2360 | 0.8567] |
| γ_2 | 3.0785 | 0.5743 | 1.9029 | 4.9672 |
| | | | [2.5631 | 5.0000] |
| γ_3 | 4.9933 | 0.9357 | 1.9964 | 5.0000 |
| μ_4 | 0.0624 | 0.0063 | 0.0527 | 0.0774 |
| ϵ_4 | 0.4411 | 0.0773 | 0.2983 | 0.5882 |

| α_2 | 0.0207 | | | |
| α_3 | 0.1666 | | | |
| α_4 | 0.4306 | | | |
| \mathcal{L} | -442.727 | | | |

Type distribution...

Level-k Theory: CGCB (ECMA 2001)

- ▶ Costa-Gomes, Crawford & Broseta (2001)
- ▶ 18 2-player NF games designed to separate:
- ▶ Naive (L1), Altruistic (max sum)
- ▶ Optimistic (maximax), Pessimistic (maximin)
- ▶ L2 (BR to L1)
- ▶ D1/D2 (1/2 round of DS deletion)
- ▶ Sophisticated (BR to empirical)
- ▶ Equilibrium (play Nash)

Level-k Theory: CGCB (ECMA 2001)

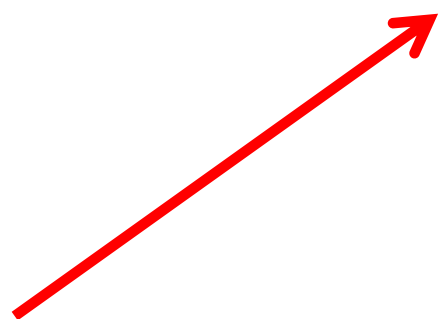

- ▶ Three treatments (all no feedback):
 - ▶ Baseline (B)
 - ▶ Mouse click to open payoff boxes
 - ▶ Open Box (OB)
 - ▶ Payoff boxes always open
 - ▶ Training (TS)
 - ▶ Rewarded to choose equilibrium strategies

Level-k Theory: CGCB (ECMA 2001)

- ▶ **Results 1**: Consistency of Strategies with Iterated Dominance
- ▶ **B, OB**: 90%, 65%, 15% equilibrium play
 - ▶ For Equilibria requiring 1, 2, 3 levels of ID
- ▶ **TS**: 90-100% equilibrium play
 - ▶ For all levels
- ▶ Game-theoretic reasoning is not computationally **difficult**, but **unnatural**.

Result 2: Estimate Subject Decision Rule

| Rule | E(u) | Choice (%) | Choice+Lookup (%) |
|---------------|-------|------------|-------------------|
| Altruistic | 17.11 | 8.9 | 2.2 |
| Pessimistic | 20.93 | 0 | 4.5 |
| Naïve | 21.38 | 22.7 | 44.8 |
| Optimistic | 21.38 | 0 | 2.2 |
| L2 | 24.87 | 44.2 | 44.1 |
| D1 | 24.13 | 19.5 | 0 |
| D2 | 23.95 | 0 | 0 |
| Equilibrium | 24.19 | 5.2 | 0 |
| Sophisticated | 24.93 | 0 | 2.2 |

Result 3: Information Search Patterns

| Subject / Rule | ↑ own payoff | | ↔ other payoff | |
|----------------|--|--------|--|--------|
| | Predicted | Actual | Predicted | Actual |
| TS (Equil.) | >31 | 63.3 | >31 | 69.3 |
| Equilibrium | >31 → | 21.5 | >31 | 79.0 |
| Naive/Opt. | <31 | 21.1 | - | 48.3 |
| Altruistic | <31 | 21.1 | - | 60.0 |
| L2 | >31 | 39.4 | =31 | 30.3 |
| D1 | >31 → | 28.3 | >31 | 61.7 |

Level-k Theory: CGCB (ECMA 2001)

- ▶ **Result 3: Information Search Patterns**
- ▶ **Occurrence** (weak requirement)
 - ▶ All necessary lookups exist somewhere
- ▶ **Adjacency** (strong requirement)
 - ▶ Payoffs compared by rule occur next to each other
- ▶ H-M-L: % of Adjacency | 100% occurrence

Result 3: Information Search Patterns

TABLE V

AGGREGATE RATES OF COMPLIANCE WITH TYPES' OCCURRENCE AND ADJACENCY FOR TS AND BASELINE SUBJECTS, AND FOR BASELINE SUBJECTS BY MOST LIKELY TYPE ESTIMATED FROM DECISIONS ALONE, IN PERCENTAGES (— VACUOUS)

| Treatment (# subjects) | <i>Altruistic</i> $j = H, M, L, 0$ | <i>Pessimistic</i> $j = H, M, L, 0$ | <i>Naïve</i> $j = H, M, L, 0$ | <i>Optimistic</i> $j = A, 0$ | <i>L2</i> $j = H, M, L, 0$ | <i>D1</i> $j = H, M, L, 0$ | <i>D2</i> $j = H, M, L, 0$ | <i>Equilibrium</i> $j = H, M, L, 0$ | <i>Sophisticated</i> $j = H, M, L, 0$ |
|---------------------------|---------------------------------------|--|----------------------------------|---------------------------------|-------------------------------|-------------------------------|-------------------------------|--|--|
| TS (12) | 3,10,50,27 | 44,7,36,13 | 83,2,0,15 | 86,14 | 76,2,0,22 | 92,3,1,5 | 92,3,1,5 | 96,1,1,3 | 75,1,1,24 |
| Baseline (45) | 14,11,51,24 | 74,2,11,14 | 78,4,4,14 | 85,15 | 67,14,5,14 | 52,19,15,14 | 50,19,15,14 | 42,23,19,16 | 39,21,20,21 |
| <i>Altruistic</i> (2) | 78,6,11,6 | 56,8,33,3 | 53,3,42,3 | 97,3 | 47,8,39,6 | 36,6,56,3 | 33,8,56,3 | 31,11,56,3 | 28,14,56,3 |

Level-k Theory: Cognitive Hierarchy

- ▶ Camerer, Ho and Chong (QJE 2004)
- ▶ Poisson distribution of level-k thinkers $f(k|\tau)$
 - ▶ $\tau =$ mean number of thinking steps
- ▶ Level-0: choose randomly or use heuristics
- ▶ Level- k thinkers use k steps of thinking BR to a mixture of lower-step thinkers
 - ▶ Belief about others is Truncated Poisson
- ▶ Easy to compute; Explains many data

Level-k Theory: CGC (AER 2006)

- ▶ Costa-Gomes & Crawford (2006)
- ▶ 2-Person Guessing Games (p -beauty contest)
 - ▶ Player 1 guesses 300-500, target = 0.7
 - ▶ Player 2 guesses 100-900, target = 1.5
 - ▶ $0.7 \times 1.5 = 1.05 > 1 \dots$
- ▶ **Unique Equilibrium @** upper bound (500, 750)
- ▶ In general:
 - ▶ Target1 x Target2 > 1 : Nash @ **upper** bounds
 - ▶ Target1 x Target2 < 1 : Nash @ **lower** bounds

Level-k Theory: CGC (AER 2006)

- ▶ 16 Different Games
- ▶ Limits:
- ▶ $\alpha = [100, 500]$, $\beta = [100, 900]$,
- ▶ $\gamma = [300, 500]$, $\delta = [300, 900]$
- ▶ Target: $1 = 0.5$, $2 = 0.7$, $3 = 1.3$, $4 = 1.5$

- ▶ No feedback – Elicit Initial Responses

Level-k Theory: CGC (AER 2006)

- ▶ Define Various Types:
- ▶ **Equilibrium (EQ)**: BR to Nash (play Nash)
- ▶ Defining **L0** as **uniformly random**
 - ▶ Based on evidence from past normal-form games
- ▶ Level-k types **L1**, **L2**, and **L3**:
- ▶ **L1**: BR to L0
- ▶ **L2**: BR to L1
- ▶ **L3**: BR to L2

Level-k Theory: CGC (AER 2006)

- ▶ Dominance types:
 - ▶ D1: Does **one round of dominance** and BR to a uniform prior over partner's remaining decisions
 - ▶ D2: Does **two rounds** and BR to a uniform prior
- ▶ **Sophisticated (SOPH)**: BR to empirical distribution of others' decisions
 - ▶ Ideal type (if all subjects are SOPH, coincide with Equilibrium)
 - ▶ See if anyone has a *transcended* understanding of others' decisions

Level-k Theory: CGC (AFR 2006)

| Game | L1 | L2 | L3 | D1 | D2 | EQ | SOPH |
|------------------------|-----|-----|-------|-------|--------|-----|------|
| 14. $\beta_4\gamma_2$ | 600 | 525 | 630 | 600 | 611.25 | 750 | 630 |
| 6. $\delta_3\gamma_4$ | 520 | 650 | 650 | 617.5 | 650 | 650 | 650 |
| 7. $\delta_3\delta_3$ | 780 | 900 | 900 | 838.5 | 900 | 900 | 900 |
| 11. $\delta_2\beta_3$ | 350 | 546 | 318.5 | 451.5 | 423.15 | 300 | 420 |
| 16. $\alpha_4\alpha_2$ | 450 | 315 | 472.5 | 337.5 | 341.25 | 500 | 375 |
| 1. $\alpha_2\beta_1$ | 350 | 105 | 122.5 | 122.5 | 122.5 | 100 | 122 |
| 15. $\alpha_2\alpha_4$ | 210 | 315 | 220.5 | 227.5 | 227.5 | 350 | 262 |
| 13. $\gamma_2\beta_4$ | 350 | 420 | 367.5 | 420 | 420 | 500 | 420 |
| 5. $\gamma_4\delta_3$ | 500 | 500 | 500 | 500 | 500 | 500 | 500 |
| 4. $\gamma_2\beta_1$ | 350 | 300 | 300 | 300 | 300 | 300 | 300 |
| 10. $\alpha_4\beta_1$ | 500 | 225 | 375 | 262.5 | 262.5 | 150 | 300 |
| 8. $\delta_3\delta_3$ | 780 | 900 | 900 | 838.5 | 900 | 900 | 900 |
| 12. $\beta_3\delta_2$ | 780 | 455 | 709.8 | 604.5 | 604.5 | 390 | 695 |
| 3. $\beta_1\gamma_2$ | 200 | 175 | 150 | 200 | 150 | 150 | 162 |
| 2. $\beta_1\alpha_2$ | 150 | 175 | 100 | 150 | 100 | 100 | 132 |
| 9. $\beta_1\alpha_4$ | 150 | 250 | 112.5 | 162.5 | 131.25 | 100 | 187 |

Level-k Theory: CGC (AER 2006)

- ▶ 43 (out of 88) subjects in the baseline made **exact guesses** (+/- 0.5) in 7 or more games
- ▶ Distribution: (L1, L2, L3, EQ) = (20, 12, 3, 8)

TABLE 1—SUMMARY OF BASELINE AND OB SUBJECTS' ESTIMATED TYPE DISTRIBUTIONS

| Type | Apparent from guesses | Econometric from guesses | Econometric from guesses, excluding random | Econometric from guesses, with specification test | Econometric from guesses and search, with specification test |
|--------------|-----------------------|--------------------------|--|---|--|
| <i>L1</i> | 20 | 43 | 37 | 27 | 29 |
| <i>L2</i> | 12 | 20 | 20 | 17 | 14 |
| <i>L3</i> | 3 | 3 | 3 | 1 | 1 |
| <i>D1</i> | 0 | 5 | 3 | 1 | 0 |
| <i>D2</i> | 0 | 0 | 0 | 0 | 0 |
| <i>Eq.</i> | 8 | 14 | 13 | 11 | 10 |
| <i>Soph.</i> | 0 | 3 | 2 | 1 | 1 |
| Unclassified | 45 | 0 | 10 | 30 | 33 |

Note: The far-right-hand column includes 17 OB subjects classified by their econometric-from-guesses type estimates.

Level-k Theory: CGC (AER 2006)

- ▶ No Dk types
- ▶ No SOPH types
- ▶ No L0 (only in the minds of L1...)
- ▶ Deviation from Equilibrium is *cognitive*
- ▶ Cannot distinguish/falsify Cognitive Hierarchy
 - ▶ BR against lower types, not just L(k-1)
- ▶ But distribution is **not Poisson** (against CH)
 - ▶ Is the Poisson assumption crucial?

Level-k Theory: CGC (AER 2006)

- ▶ **Pseudotypes:** Constructed with subjects' guesses in 16 games (pseudo-1 to pseudo-88)
- ▶ **Specification Test:** Compare the likelihood of subject's type with likelihoods of pseudotypes
 - ▶ Should beat at least $87/8 = 11$ pseudotypes
 - ▶ Unclassified if failed
- ▶ **Omitted Type Test:** Find **clusters** that
 - ▶ (a) Look like each other, but (b) not like others
 - ▶ Pseudotype likelihoods high within, low outside

Level-k Theory: CGC (AER 2006)

- ▶ 5 small clusters; total = 11 of 88 subjects
- ▶ Other clusters?
 - ▶ Could find more smaller clusters in a larger sample, but size smaller than 2/88 (approx. 2%)
- ▶ **Smaller clusters could be treated as errors**
 - ▶ No point to build one model per subject...
 - ▶ A model for only 2% of population is not general enough to make it worth the trouble

Level-k Theory: CGC (AER 2006)

- ▶ Large fraction of subjects' deviations from equilibrium explained by Level-k model
 - ▶ (that can be explained by a model)
- ▶ Although the model explains only half+ of subjects' deviations from equilibrium,
- ▶ it may still be optimal for a modeler to treat the rest of the deviations as errors
 - ▶ Since the rest is not worth modeling...

Does Level-k Explain Hide-and-Seek Games?

- ▶ Aggregate RTH Hide-and-Seek Game Results:
- ▶ Both Hiders and Seekers **over-choose central A**
- ▶ Seekers choose **central A** even more than hiders

| | A | B | A | A |
|------------------|----------|----------|---------------|----------|
| Hiders (624) | 0.2163 | 0.2115 | 0.3654 | 0.2067 |
| Seekers (560) | 0.1821 | 0.2054 | 0.4589 | 0.1536 |

Hide-and-Seek: Crawford and Iriberry (2007)

- ▶ Can a strategic theory explain this?
- ▶ **Level-k**: Each role is filled by L_k types: L_0 , L_1 , L_2 , L_3 , or L_4 (probabilities to be estimated)
 - ▶ Note: In Hide and Seek the types cycle after L_4 ...
- ▶ High types anchor beliefs in a naive L_0 type and adjusts with iterated best responses:
 - ▶ L_1 best responds to L_0 (with uniform errors)
 - ▶ L_2 best responds to L_1 (with uniform errors)
 - ▶ ...
 - ▶ L_k best responds to L_{k-1} (with uniform errors)

Hide-and-Seek Game: Anchoring Type Level-0

- ▶ **L0** Hiders and Seekers are symmetric
 - ▶ Favor salient locations equally
- 1. Favor **B**: choose with probability $q > 1/4$
- 2. Favor **end A**: choose with prob. $p/2 > 1/4$
 - ▶ Choice probabilities: $(p/2, q, 1 - p - q, p/2)$
- ▶ **Note**: Specification of **Anchoring Type L0** is the key to model's explanatory power
 - ▶ See Crawford and Iriberri (AER 2007) for other **L0**
 - ▶ Cannot use uniform **L0** (coincide with equilibrium)

Hide-and-Seek: Crawford and Iriberri (2007)

- ▶ More (or less) attracted to B: $p/2 < q$ ($p/2 > q$)
- ▶ L1 Hiders choose central A

TABLE 2—TYPES' EXPECTED PAYOFFS AND CHOICE PROBABILITIES IN RTH'S GAMES WHEN $p > 1/2$ AND $q > 1/4$

| Hider | Expected payoff | Choice probability | Expected payoff | Choice probability | Seeker | Expected payoff | Choice probability | Expected payoff | Choice probability |

Hide-and-Seek Game: Explain Stylized Facts

- ▶ Given $L0$ playing $(p/2, q, 1 - p - q, p/2)$,
 - ▶ $L1$ Hiders choose central A (avoid $L0$ Seekers)
 - ▶ $L1$ Seekers avoid central A (search for $L0$ Hiders)
- ▶ $L2$ Hiders choose central A with prob. in $[0,1]$
- ▶ $L2$ Seekers choose central A for sure

- ▶ $L3$ Hiders avoid central A
- ▶ $L3$ Seekers choose central A w/ prob. in $[0,1]$

- ▶ $L4$ Hiders and Seekers both avoid central A

Hide-and-Seek Game: Explain Stylized Facts

- ▶ To reproduce the stylized facts, need
 - ▶ Heterogeneous Population (L0, L1, L2, L3, L4) = (r, s, t, u, v) with $r=0$, t & u large, s not too large
 - ▶ Need $s < (2t+u)/3$ (More B), or
 $s < (t+u)/2$ (Less B)
 - ▶ estimated $r = 0$, $s=19\%$, $t=32\%$, $u=24\%$,

| Total | $p < 2q$ | $p > 2q$ | Total | $p < 2q$ | $p > 2q$ |
|-------|---|---|-------|---|---|
| A | $rp/2+(1-\varepsilon)[t/3+u/3]$ $+ (1-r)\varepsilon/4$ | $rp/2+(1-\varepsilon)[u/3+v/2]$ $+ (1-r)\varepsilon/4$ | A | $rp/2+(1-\varepsilon)[u/3+v/3]$ $+ (1-r)\varepsilon/4$ | $rp/2+(1-\varepsilon)[s/2+v/3]$ $+ (1-r)\varepsilon/4$ |
| B | $rq+(1-\varepsilon)[u/3+v]$ $+ (1-r)\varepsilon/4$ | $rq+(1-\varepsilon)[t/2+u/3]$ $+ (1-r)\varepsilon/4$ | B | $rq+(1-\varepsilon)[s+v/3]$ $+ (1-r)\varepsilon/4$ | $rq+(1-\varepsilon)[u/2+v/3]$ $+ (1-r)\varepsilon/4$ |
| A | $r(1-p-q)+(1-\varepsilon)[s+t/3]$ $+ (1-r)\varepsilon/4$ | $r(1-p-q)+(1-\varepsilon)[s+t/2]$ $+ (1-r)\varepsilon/4$ | A | $r(1-p-q)+(1-\varepsilon)[t+u/3]$ $+ (1-r)\varepsilon/4$ | $r(1-p-q)+(1-\varepsilon)[t+u/2]$ $+ (1-r)\varepsilon/4$ |
| A | $rp/2+(1-\varepsilon)[t/3+u/3]$ $+ (1-r)\varepsilon/4$ | $rp/2+(1-\varepsilon)[u/3+v/2]$ $+ (1-r)\varepsilon/4$ | A | $rp/2+(1-\varepsilon)[u/3+v/3]$ $+ (1-r)\varepsilon/4$ | $rp/2+(1-\varepsilon)[s/2+v/3]$ $+ (1-r)\varepsilon/4$ |

Hide-and-Seek: Out of Sample Prediction

- ▶ Estimate on one treatment and predict other five treatments
 - ▶ 30 Comparisons: 6 estimations, each predict 5
- ▶ This Level-k Model with symmetric $L0$ beats other models (LQRE, Nash + noise)
 - ▶ Mean Squared prediction Error (MSE) 18% lower
 - ▶ Better predictions in 20 of 30 comparisons

HS Level-k Model Ported to Joker Game

- ▶ Can Level-k thinking from the Hide-and-Seek Game predict results of other games?
 - ▶ Try O'Neill (1987)'s Joker Game
- ▶ Stylized Facts:
 - ▶ Aggregate Frequencies close MSE
 - ▶ Ace Effect (A chosen more often than 2 or 3);
 - ▶ Not captured by QRE

The Joker Game: O'Neill (1987)

| | A | 2 | 3 | J | MSE | Actual | QRE |
|--------|-------|-------|-------|-------|-----|--------|-------|
| A | -5 | 5 | 5 | -5 | 0.2 | 0.221 | 0.213 |
| 2 | 5 | -5 | 5 | -5 | 0.2 | 0.215 | 0.213 |
| 3 | 5 | 5 | -5 | -5 | 0.2 | 0.203 | 0.213 |
| J | -5 | -5 | -5 | 5 | 0.4 | 0.362 | 0.360 |
| MSE | 0.2 | 0.2 | 0.2 | 0.4 | | | |
| Actual | 0.226 | 0.179 | 0.169 | 0.426 | | | |
| QRE | 0.191 | 0.191 | 0.191 | 0.427 | | | |

- ▶ Actual frequencies are quite close to MSE
- ▶ QRE better, but cannot get the Ace effect

HS Level-k Model Ported to Joker Game

- ▶ Level- k model w/ symmetric $L0$ (favor A&J)
- ▶ $L0$: $(a, (1-a-j)/2, (1-a-j)/2, j)$, $a, j > 1/4$
 - ▶ A and J, 'face' cards and end locations, are more salient than 2 and 3...
- ▶ Higher Lk type BR to $L(k-1)$ (Table A3-A4)
- ▶ Challenge: To get the Ace Effect (without $L0$), need a population of almost all $L4$ or $L3$
 - ▶ This is an empirical question, but very unlikely

HS Level-k Model Ported to Joker Game

- ▶ Could there be **no Ace Effect** in the **initial rounds** of O'Neil's data?
 - ▶ The Level-k model predicts a Joker Effect instead!
- ▶ Crawford and Ireberri asked for O'Neil's data
 - ▶ And they found...
- ▶ Initial Choice Frequencies
 - ▶ $(A, 2, 3, J) = (8\%, 24\%, 12\%, 56\%)$ for Player 1
 - ▶ $(A, 2, 3, J) = (16\%, 12\%, 8\%, 64\%)$ for Player 2

Table 5. Comparison of the Leading Models in O'Neill's Game

| Model | Parameter estimates | Observed or predicted choice frequencies | | | | | MSE |
|---|--|--|--------|--------|--------|--------|--------|
| | | Player | A | 2 | 3 | J | |
| Observed frequencies (25 Player 1s, 25 Player 2s) | | 1 | 0.0800 | 0.2400 | 0.1200 | 0.5600 | - |
| | | 2 | 0.1600 | 0.1200 | 0.0800 | 0.6400 | - |
| Equilibrium without perturbations | | 1 | 0.2000 | 0.2000 | 0.2000 | 0.4000 | 0.0120 |
| | | 2 | 0.2000 | 0.2000 | 0.2000 | 0.4000 | 0.0200 |
| Level- k with a role-symmetric LO that favors salience | $a > 1/4$ and $j > 1/4$ $3j - a < 1, a + 2j < 1$ | 1 | 0.0824 | 0.1772 | 0.1772 | 0.5631 | 0.0018 |
| | | 2 | 0.1640 | 0.1640 | 0.1640 | 0.5081 | 0.0066 |
| Level- k with a role-symmetric LO that favors salience | $a > 1/4$ and $j > 1/4$ $3j - a < 1, a + 2j > 1$ | 1 | 0.0000 | 0.2541 | 0.2541 | 0.4919 | 0.0073 |
| | | 2 | 0.2720 | 0.0824 | 0.0824 | 0.5631 | 0.0050 |
| Level- k with a role-symmetric LO that avoids salience | $a < 1/4$ and $j < 1/4$ | 1 | 0.4245 | 0.1807 | 0.1807 | 0.2142 | 0.0614 |
| | | 2 | 0.1670 | 0.1807 | 0.1807 | 0.4717 | 0.0105 |
| Level- k with a role-asymmetric LO that favors salience for locations for which player is a seeker and avoids it for locations for which player is a hider | $a_1 < 1/4, j_1 > 1/4;$ $a_2 > 1/4, j_2 < 1/4$ $3j_1 - a_1 < 1, a_1 + 2j_1 < 1,$ $3a_2 + j_2 > 1$ | 1 | 0.1804 | 0.2729 | 0.2729 | 0.2739 | 0.0291 |
| | | 2 | 0.1804 | 0.1804 | 0.1804 | 0.4589 | 0.0117 |

Conclusion

- ▶ Limit of Strategic Thinking: 2-3 steps
- ▶ Theory (for initial responses)
- ▶ Level-k Types:
 - ▶ Stahl-Wilson (GEB 1995), CGCB (ECMA 2001)
 - ▶ Costa-Gomes and Crawford (AER 2006)
 - ▶ Ho and Su (MS 2013)
 - ▶ Chen, Huang and Wang (GEB 2018)
- ▶ Cognitive Hierarchy:
 - ▶ Camerer, Ho and Chong (QJE 2004)

Applications of Level-k Thinking

- ▶ p -Beauty Contest:
 - ▶ Costa-Gomes and Crawford (AER 2006)
 - ▶ Chen, Huang and Wang (GEB 2018)
- ▶ MSE:
 - ▶ Hide-and-Seek: Crawford and Iriberri (AER 2007)
 - ▶ LUPI: Ostling, Wang, Chou and Camerer (AEJmicro 2011)
- ▶ Auctions:
 - ▶ Overbidding: Crawford and Iriberri (AER 2007)
 - ▶ Repeated eBay Auctions: Wang (2006)

More Applications

- ▶ Coordination-Battle of the Sexes (Simple Market Entry Game):
 - ▶ Camerer, Ho and Chong (QJE 2004)
 - ▶ Crawford (2007)
- ▶ Pure Coordination Games:
 - ▶ Crawford, Gneezy and Rottenstreich (AER 2008)
- ▶ Pre-play Communication:
 - ▶ Crawford (AER 2003)
 - ▶ Ellingsen and Ostling (AER 2011)

More Applications

- ▶ **Strategic Information Communication:**
 - ▶ Crawford (AER 2003)
 - ▶ Cai and Wang (GEB 2006)
