

Supporting Prices and Convexity

Joseph Tao-yi Wang
2009/11/6

(Lecture 8, Micro Theory I)

Overview of Chapter 1

- Theory of Constrained Maximization
 - Why should we care about this?
- What is Economics?
- Economics is **the study of how society manages its scarce resources** (Mankiw, Ch.1)
 - “Economics is the science which studies human behavior as a relationship between given ends and scarce means which have alternative uses.”
([Lionel Robbins](#), 1932)

Overview of Chapter 1

- Other Historical Accounts:
 - Economics is the “study of how societies use scarce resources to produce valuable commodities and distribute them among different people.” ([Paul A. Samuelson](#), 1948)
- My View: Economics is a study of institutions and human behavior (reactions to institutions)
- Either way, constrained maximization is key...

Overview of Chapter 1

- Tools Introduced in Chapter 1:
 1. Supporting Hyperplanes (and Convexity)
 2. First Order Conditions (Kuhn-Tucker)
 3. Envelope Theorem
- But why do I need to know the math?
 - Along the way, please let me know if you expect to use these tools in the future (in work)...

Publication Reward Problem

- Example: How should NTU reward its professors to publish journal articles?
 - Should NTU pay, say, NT\$300,000 per article published in Science or Nature?
- Well, it depends...
- Peek the answer ahead:
 - Yes, if the production set is convex.
 - No, if, for example, there is initial increasing returns to scale.

Supporting Prices

- More generally, can **prices** and **profit** maximization provide appropriate incentives for all **efficient production plans**?
 - Is there a price vector that supports each efficient production plan?
- (Yes, but when?)
- Need some definitions first...

Production Plant

- A production facility can produce n output $q = (q_1, \dots, q_n)$ using up to m input $z = (z_1, \dots, z_m)$
- Production Plan $y = (-z_1, \dots, -z_m, q_1, \dots, q_n)$
- Price vector $p = (p_1, \dots, p_{m+n})$

- Profit
$$\Pi = \underbrace{\sum_{i=m+1}^{m+n} p_i y_i}_{\text{total revenue}} - \underbrace{\sum_{i=1}^m p_i z_i}_{\text{total cost}} = p \cdot y$$

Production Plan

- Production Set Υ

=Set of Feasible Production Plan

- \bar{y} is production efficient (=non-wasteful) if

There is no $y \in \Upsilon$ such that $y > \bar{y}$

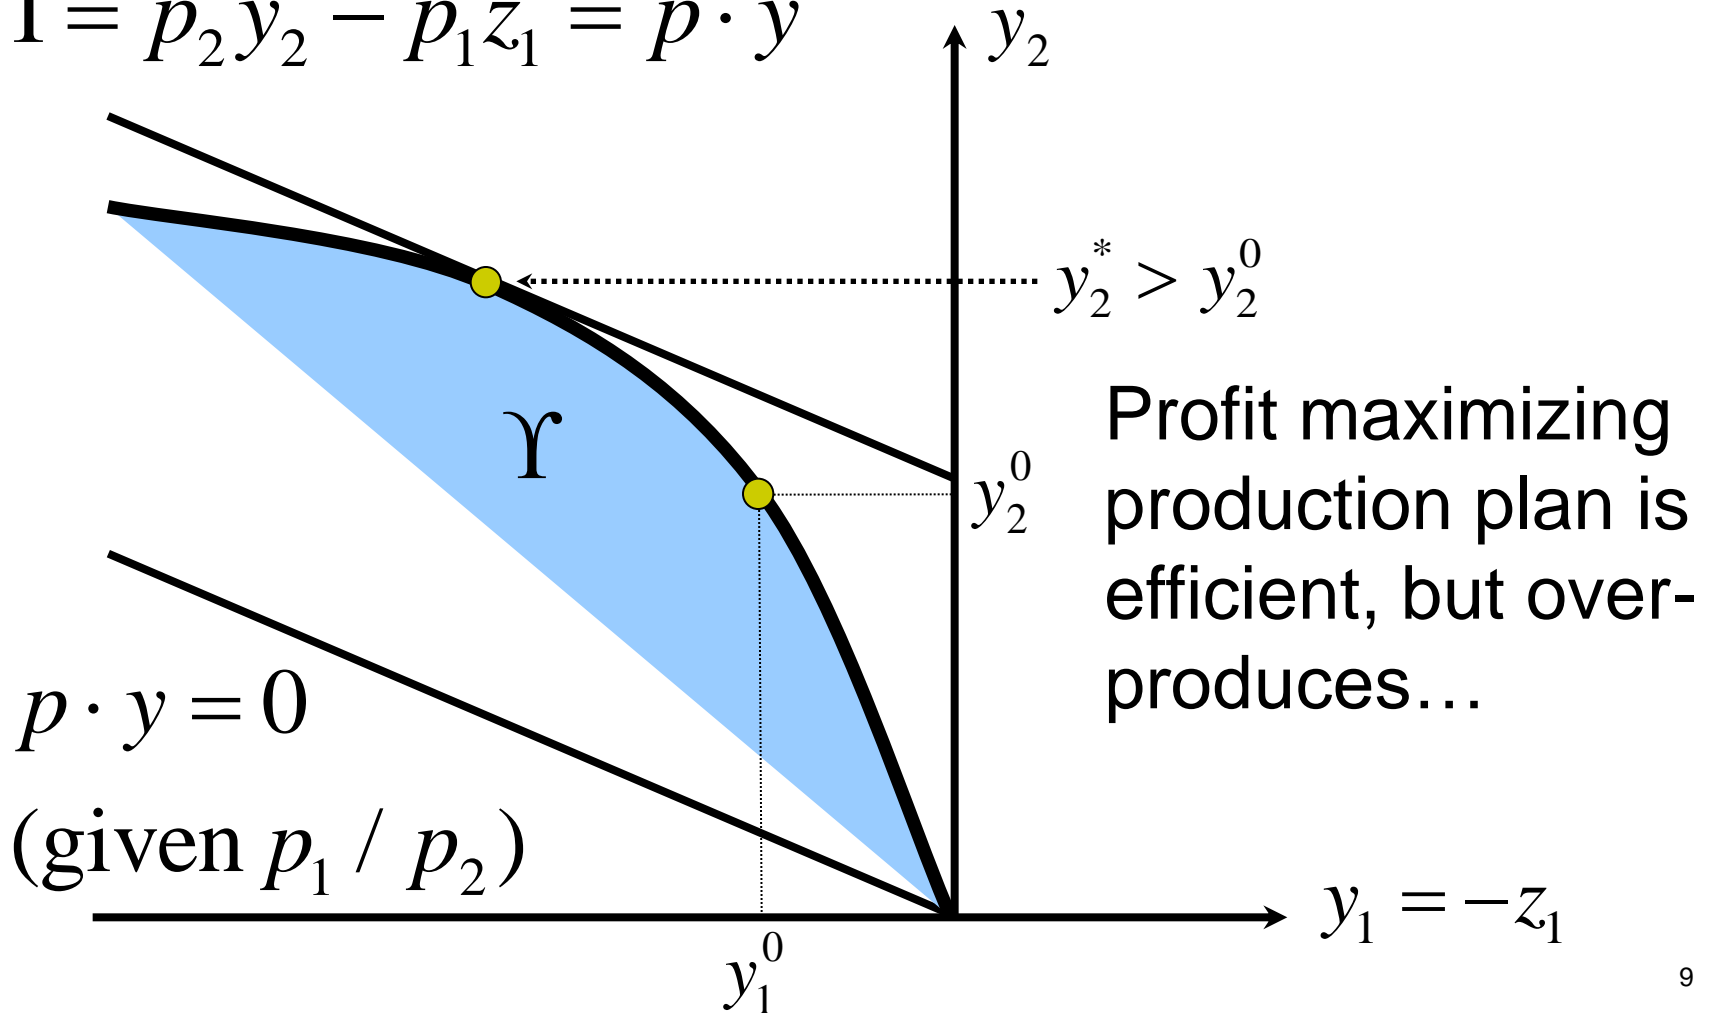

- Note: $y \geq \bar{y}$ if $y_j \geq \bar{y}_j$ for all j

$y > \bar{y}$ if inequality is strict for some j

Can Prices Support an Efficient Production Plan?

$$\Pi = p_2 y_2 - p_1 z_1 = p \cdot y$$

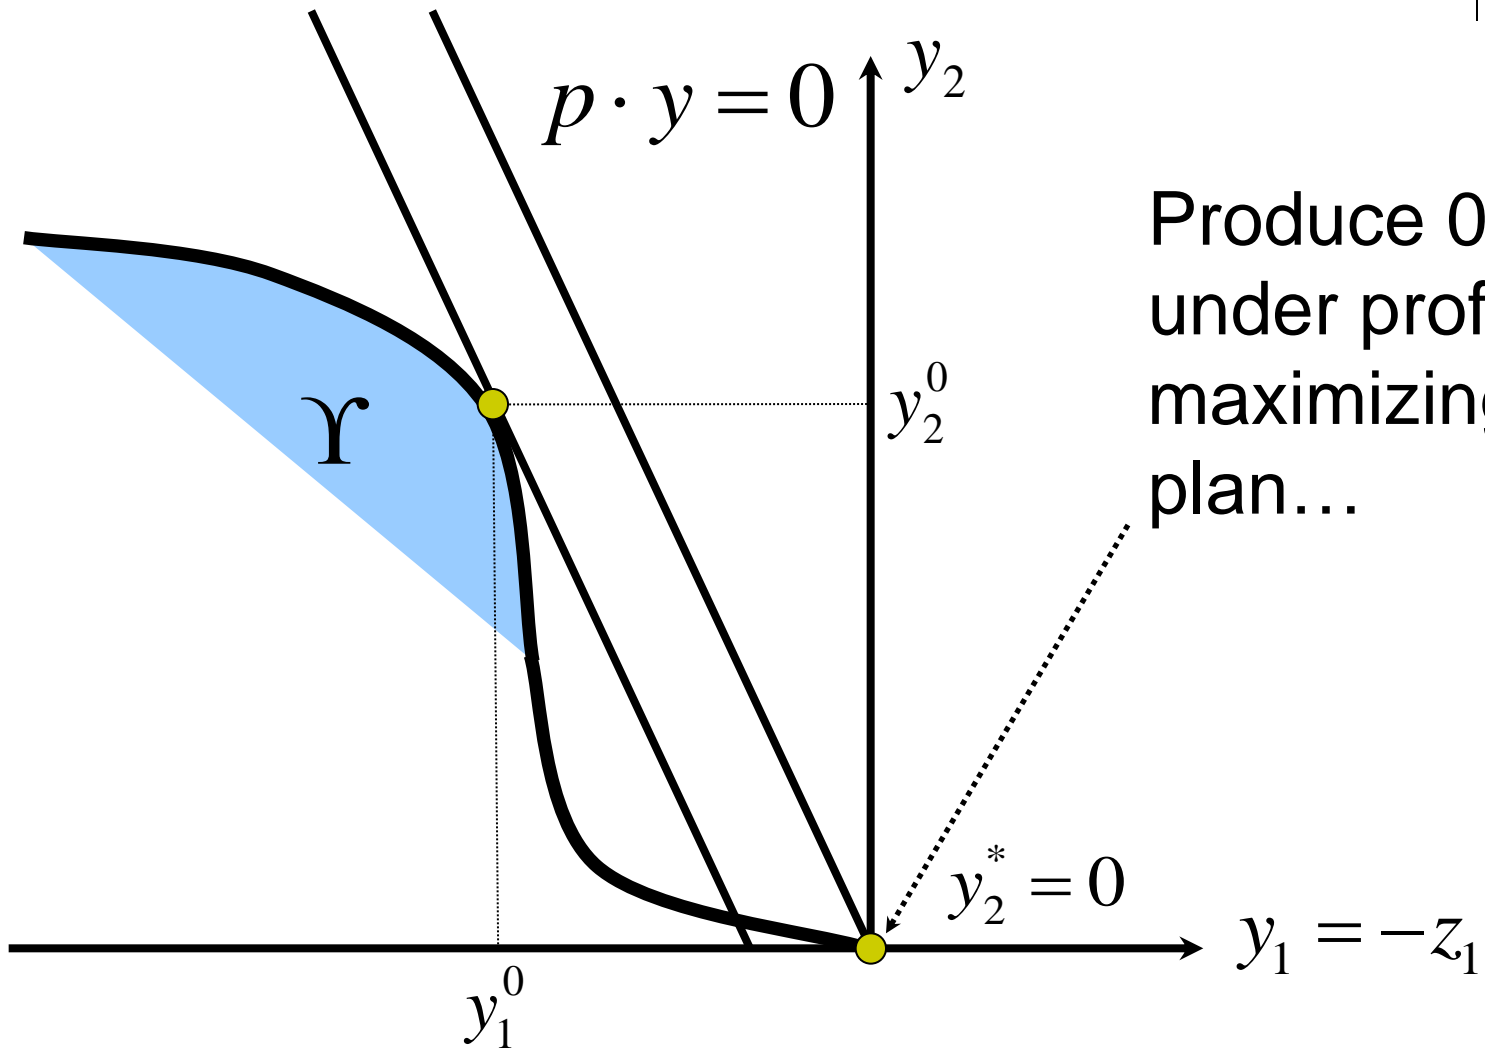

If That Was Too High, Let's Lower the Transfer Price...

Will this Always Work?

What Made It Fail?

- The last production set was NOT **convex**.

- S is **convex** iff for all $y^0, y^1 \in S$,

$$y^\lambda = \lambda \cdot y^0 + (1 - \lambda) \cdot y^1 \in S$$

- Is it true that we can use prices to guide production decisions as long as production sets are convex?

Supporting Hyperplane Theorem

- Proposition 1.1-1:

Suppose Υ is closed and convex,
and y^0 lies on the boundary of Υ .

Then there exists $p \neq 0$, such that

- (i) for all $y \in \Upsilon$, $p \cdot y \leq p \cdot y^0$, and
- (ii) for all $y \in \text{int}\Upsilon$, $p \cdot y < p \cdot y^0$.

Special Case of Supporting Hyperplane Theorem

- “Proposition” 1.1- “1.5”:

The production set Υ is the upper contour set

$\{y \mid h(y) \geq h(y^0)\}$ of h , quasi-concave, differentiable

Suppose the gradient vector of h is non-zero at y^0 .

$$\text{Define } p = -\frac{\partial h}{\partial y}(y^0),$$

then $p \cdot y \leq p \cdot y^0$ for all $y \in \Upsilon$.

Quasi-Concavity

- f is **quasi-concave** if the upper contour set of f set are convex. Equivalently, for any y^0, y^1 and convex combination

$$y^\lambda = \lambda \cdot y^0 + (1 - \lambda) \cdot y^1,$$

$$f(y^\lambda) \geq \min \{ f(y^0), f(y^1) \}.$$

- Why is this useful?
 - Because we have...

Quasi-Concavity

- If f is differentiable and quasi-concave, then $f(y) \geq f(y^0)$ implies $\frac{\partial f}{\partial x}(y^0) \cdot (y - y^0) \geq 0$
- This tells us how to calculate the supporting prices (under this special case)...

Example

- A professor has 25 units of “brain-power”
- Allocates z_1 units to produce TSSCI papers
Produce $y_1 = 2\sqrt{z_1}$ number of TSSCI papers
- Allocates z_2 units to produce SSCI papers
Produce $y_2 = \sqrt{z_2}$ number of SSCI papers
- Set of feasible output is

$$Y = \left\{ y \mid h(y) = 25 - \frac{1}{4} y_1^2 - y_2^2 \right\}$$

Example

- Professor W is working at full capacity
Professor W's output $y^0 = (8, 3)$ (on the boundary)
- What kind of reward scheme can support this?

$$p = -\frac{\partial h}{\partial y}(y^0) = \left(\frac{1}{2} y_1^0, 2y_2^0 \right) = (4, 6)$$

- How can university induce $y^1 = (2, 2\sqrt{6}) \approx (2, 5)$?

$$p = -\frac{\partial h}{\partial y}(y^1) = \left(\frac{1}{2} y_1^1, 2y_2^1 \right) = (1, 4\sqrt{6}) \approx (1, 10)$$

Separating Hyperplane Theorem

- Proposition 1.1-2:

Suppose S and T are convex sets

with a common boundary point $s^0 = t^0$
and no common interior points.

Then there is some p such that,

for all $s \in S$ and $t \in T$, $p \cdot s \leq p \cdot t$.

(Inequality strict if either s or t is an interior.)

Separating Hyperplane Theorem

- Proof of Proposition 1.1-2:

Define $Y = S - T$, then $s^0 - t^0 = 0 \in Y$

If Y is convex (verify this!!!), then...

Supporting Hyperplane Theorem says:

there is some $p \neq 0$ such that, for all $y \in Y$,

$$p \cdot y \leq p \cdot (s^0 - t^0) = 0.$$

Since $y = s - t$ for some $s \in S, t \in T$,

$$p \cdot s \leq p \cdot t \text{ for all } s \in S, t \in T.$$

Positive Prices (Free Disposal)

- Two hyperplane theorems have economic meaning if prices are positive
 - Need another assumption
- Free Disposal

For any feasible production plan $y \in Y$ and any $\delta > 0$, the production plan $y - \delta$ is also feasible.

Supporting Prices

- With free disposal, we can prove:
- Proposition 1.1-3:

If y^0 is a boundary point of a convex sets Υ and the free disposal assumption holds, then

Then there exist a price vector $p \geq 0$ such that

$p \cdot y \leq p \cdot y^0$ for all $y \in \Upsilon$.

(Moreover, if $0 \in \Upsilon$, then $p \cdot y^0 \geq 0$.)

Supporting Prices

- Proof of Proposition 1.1-3:
Supporting Hyperplane Theorem says:
there is some $p \neq 0$ such that, for all $y \in Y$,
 $p \cdot (y^0 - y) \geq 0$. Now need to show $p_i \geq 0$.
By free disposal, $y' = y^0 - \delta \in Y$ for all $\delta > 0$.
Setting $\delta = (1, 0, \dots, 0)$, $p \cdot (y^0 - y') = p_1 \geq 0$.
Setting $\delta = (0, 1, 0, \dots, 0)$, $p \cdot (y^0 - y') = p_2 \geq 0$.
...Setting $\delta = (0, \dots, 0, 1)$, $p \cdot (y^0 - y') = p_n \geq 0$.²³

Back to Publication Rewards

- Should NTU really pay NT\$300,000 per article published in Science or Nature?
 - Is the production set for Science/Nature convex?
- What would be a better incentive scheme to encourage publications in Science/Nature?
 - Efficient Wages (High Fixed Wages)?
 - Tenure?
 - Endowed Chair Professorships?

Back to Publication Rewards

- What are some tasks do you expect piece-rate incentives to work?
 - Sales
 - Real estate agents
- What about a fixed payment?
 - Secretaries and Office Staff
 - Store Clerk
- What about other incentives schemes?
 - That's for you to answer (in contract theory)!

Summary of 1.1

- Input = Negative Output
- Vector space of y
- Convexity (quasi-concavity) is the key for supporting prices (=linearization)
- What is a good incentive scheme to induce professor to publish in Science and Nature?
- Consumer = Producer
- Homework: Try Last Year's Exam questions
