

Modified by Joseph Tao-yi Wang 2013 UPDATE

In this chapter, look for the answers to these questions:

- What is consumer surplus? How is it related to the demand curve?
- What is producer surplus? How is it related to the supply curve?
- Do markets produce a desirable allocation of resources? Or could the market outcome be improved upon?

Welfare Economics

- Recall, the allocation of resources refers to:
 how much of each good is produced
 - which producers produce it

 - which consumers consume it
- Welfare economics studies <u>how</u> the allocation of resources affects economic well-being.
- First, we look at the well-being of consumers.

Willingness to Pay (WTP)

A buyer's **willingness to pay** for a good is the maximum amount the buyer will pay for that good.

WTP measures how much the buyer values the good.

name	WTP	Example: 4 buyers' WTP for an iPad	
Anthony	\$250		
Kenny	175		
Quan	300	-	
John	125		
			3

Cost a	nd th	e Supply Curve	
Cost is up to pr	the val oduce	ue of everything a seller must give a good (i.e., opportunity cost).	!
 Include good, ir 	s cost o ncluding	of all resources used to produce g value of the seller's time.	
 Example busines 	e: Cos s.	ts of 3 sellers in the lawn-cutting	
name	cost	A seller will produce and sell the good/service only if the price exceeds his or her cost	
Rosy	\$10		
Chuck	20	Hence, cost is a measure of	
Chiang	35	willingness to sell.

The Market's Allocation of Resources

- In a market economy, the allocation of resources is decentralized, determined by the interactions of many self-interested buyers and sellers.
- Is the market's allocation of resources desirable? Or would a different allocation of resources make society better off?
- To answer this, we use total surplus as a measure of society's well-being, and we consider whether the market's allocation is *efficient*.

(Policymakers also care about *equality*, though our focus here is on efficiency.)

Efficiency

```
Total surplus = (value to buyers) - (cost to sellers)
```

An allocation of resources is **efficient** if it maximizes total surplus. Efficiency means:

- The goods are consumed by the buyers who value them most highly.
- The goods are produced by the producers with the lowest costs.
- Raising or lowering the quantity of a good would not increase total surplus.

Adam Smith and the Invisible Hand

Passages from The Wealth of Nations, 1776

Adam Smith, 1723-1790 "Man has almost constant occasion for the help of his brethren, and it is vain for him to expect it from their benevolence only. He will be more likely to prevail if he can interest their self-love in his favor, and show them that it is for their own advantage to do for him what he requires of them... It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard to their own interest....

Adam Smith and the Invisible Hand

Passages from The Wealth of Nations, 1776

"Every individual...neither intends to promote the public interest, nor knows how much he is promoting it.... He intends only his own gain, and he is in this, as in many other cases, led by **an invisible hand** to promote an end which was no part of his intention. Nor is it always the worse for the society that it was no part of it. By pursuing his own interest he frequently promotes that of the society more effectually than when he really intends to promote it."

Adam Smith, 1723-1790

The Free Market vs. Govt Intervention

- The market equilibrium is efficient. No other outcome achieves higher total surplus.
- Govt cannot raise total surplus by changing the market's allocation of resources.
- Laissez faire (French for "allow them to do"): the notion that govt should not interfere with the market.

The Free Market vs. Central Planning

- Suppose resources were allocated not by the market, but by a central planner who cares about society's well-being.
- To allocate resources efficiently and maximize total surplus, the planner would need to know every seller's cost and every buyer's WTP for every good in the entire economy.
- This is impossible, and why centrally-planned economies are never very efficient.

40

41

CONCLUSION

- This chapter used welfare economics to demonstrate one of the Ten Principles: Markets are usually a good way to organize economic activity.
- Important note: We derived these lessons assuming perfectly competitive markets.
- In other conditions we will study in later chapters, the market may fail to allocate resources efficiently...

CONCLUSION

- Such market failures occur when:
 - a buyer or seller has market power—the ability to affect the market price.
 - transactions have side effects, called *externalities*, that affect bystanders. (example: pollution)
- We'll use welfare economics to see how public policy may improve on the market outcome in such cases.
- Despite the possibility of market failure, the analysis in this chapter applies in many markets, and the invisible hand remains extremely important.

43

SUMMARY

- The height of the **D** curve reflects the value of the good to buyers—their willingness to pay for it.
- Consumer surplus is the difference between what buyers are willing to pay for a good and what they actually pay.
- On the graph, consumer surplus is the area between *P* and the *D* curve.

SUMMARY

42

- The height of the S curve is sellers' cost of producing the good. Sellers are willing to sell if the price they get is at least as high as their cost.
- Producer surplus is the difference between what sellers receive for a good and their cost of producing it.
- On the graph, producer surplus is the area between *P* and the *S* curve.

SUMMARY

- To measure society's well-being, we use total surplus, the sum of consumer and producer surplus.
- Efficiency means that total surplus is maximized, that the goods are produced by sellers with lowest cost, and that they are consumed by buyers who most value them.
- Under perfect competition, the market outcome is efficient. Altering it would reduce total surplus.

Efficiency and Welfare

- Consumer Surplus + Producer Surplus
- = Total Surplus (maximized at Equilibrium)
- Efficiency vs. Equality
- Homework: Mankiw, Ch. 7, pp. 152-154, problems 6, 7, 8, 11, 12.
- True or False. If consumers buy 1,000 heads of lettuce per week, and if the price of lettuce falls by \$1 per head, then the consumer surplus will increases by \$1,000.
