

#### In this chapter, look for the answers to these questions

- What outcomes are possible under oligopoly?
- Why is it difficult for oligopoly firms to cooperate?
- How are antitrust laws used to foster competition?

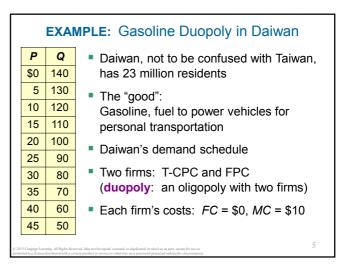

### Measuring Market Concentration

- Concentration ratio: the percentage of the market's total output supplied by its four largest firms.
- The higher the concentration ratio, the less competition.
- This chapter focuses on oligopoly, a market structure with high concentration ratios.

Industry	Concentration ratio
Video game consoles	100%
Tennis balls	100%
Credit cards	99%
Batteries	94%
Soft drinks	93%
Web search engines	92%
Breakfast cereal	92%
Cigarettes	89%
Greeting cards	88%
Beer	85%
Cell phone service	82%
Autos	79%

### Oligopoly

- Oligopoly: a market structure in which only a few sellers offer similar or identical products.
- Strategic behavior in oligopoly: A firm's decisions about *P* or *Q* can affect other firms and cause them to react. The firm will consider these reactions when making decisions.
- **Game theory**: the study of how people behave in strategic situations.

Ρ	Q	Revenue	Cost	Profit	Competitive
\$0	140	\$0	\$1,400	-1,400	outcome:
5	130	650	1,300	-650	<b>P</b> = MC = \$10
10	120	1,200	1,200	0	<b>Q</b> = 120 Profit = \$0
15	110	1,650	1,100	550	$r_{10}$ in the $p_{0}$
20	100	2,000	1,000	1,000	
25	90	2,250	900	1,350	Monopoly
30	80	2,400	800	1,600	outcome:
35	70	2,450	700	1,750	<b>P</b> = \$40
40	60	2,400	600	1,800	<b>Q</b> = 60
45	50	2,250	500	1,750	Profit = \$1,800

#### **EXAMPLE:** Gasoline Duopoly in Daiwan

- One possible duopoly outcome: collusion
- Collusion: an agreement among firms in a market about quantities to produce or prices to charge
- T-CPC and FPC could agree to each produce half of the monopoly output:

• For each firm: *Q* = 30, *P* = \$40, profits = \$900

• **Cartel**: a group of firms acting in unison, e.g., T-CPC and FPC in the outcome with collusion

ACTIVE LEARNING 1 Collusion vs. self-interest			
	Ρ	Q	Duopoly outcome with collusion:
	\$0	140	Each firm agrees to produce <b>Q</b> = 30,
	5	130	earns profit = \$900.
	10	120	If T-CPC reneges on the agreement and
	15	110	produces $Q = 40$ , what happens to the
	20	100	market price? T-CPC's profits?
	25	90	Is it in T-CPC's interest to renege on the
	30	80	agreement?
	35	70	If both firms renege and produce $Q = 40$ ,
	40	60	determine each firm's profits.
	45	50	

ACTIVE LEARNING 1 Answers			
F	Q	If both firms stick to agreement,	
\$	) 140	each firm's profit = \$900	
4	5 130	If T-CPC reneges on agreement and	
1	) 120	produces $Q = 40$ :	
1	5 110	Market quantity = 70, $P = $35$	
2	) 100	T-CPC's profit = 40 x (\$35 – 10) = \$1000	
2	5 90	T-CPC's profits are higher if it reneges.	
3	0 80	FPC will conclude the same, so	
3	5 70	both firms renege, each produces $Q = 40$ :	
4	) 60	Market quantity = $80$ , $P = $30$	
4	5 50	Each firm's profit = 40 x (\$30 – 10) = \$800	

### Collusion vs. Self-Interest

- Both firms would be better off if both stick to the cartel agreement.
- But each firm has incentive to renege on the agreement.
- Lesson: It is difficult for oligopoly firms to form cartels and honor their agreements.

10

active learning 2 The oligopoly equilibrium			
Р	Q	If each firm produces <b><i>Q</i></b> = 40,	
\$0	140	market quantity = 80	
5	130	<b>P</b> = \$30	
10	120	each firm's profit = \$800	
15	110	Is it in T-CPC's interest to increase its	
20	100	output further, to <b>Q</b> = 50?	
25	90	Is it in FPC's interest to increase its output	
30	80	to <b>Q</b> = 50?	
35	70		
40	60		
45	50		

Ans	swer	S	The Equilibrium for an Oligopoly
<b>P</b> \$0 5 10	<b>Q</b> 140 130 120 110	If each firm produces $Q = 40$ , then each firm's profit = \$800. If T-CPC increases output to $Q = 50$ : Market quantity = 90, $P = $25$ T-CPC's profit = 50 x ( $$25 - 10$ ) = \$750	<ul> <li>Nash equilibrium: a situation in which economic participants interacting with one anothe each choose their best strategy given the strategies that all the others have chosen</li> <li>Our duopoly example has a Nash equilibrium</li> </ul>
20 25	100 90	T-CPC's profits are higher at $Q = 40$ than at $Q = 50$ .	<ul> <li>in which each firm produces Q = 40.</li> <li>Given that FPC produces Q = 40, T-CPC's best move is to produce Q = 40.</li> </ul>
30 35 40	80 70 60	The same is true for FPC.	<ul> <li>Given that T-CPC produces <i>Q</i> = 40, FPC's best move is to produce <i>Q</i> = 40.</li> </ul>

14

When firms in an oligopoly individually choose production to maximize profit,

- oligopoly Q is greater than monopoly Q but smaller than competitive Q.
- oligopoly *P* is greater than competitive *P* but less than monopoly *P*.

#### The Output & Price Effects

- Increasing output has two effects on a firm's profits:
   Output effect:
  - If P > MC, increasing output raises profits.
  - Price effect: Raising output increases market quantity, which reduces price and reduces profit on all units sold.
- If output effect > price effect, the firm increases production.
- If price effect > output effect, the firm reduces production.

## The Size of the Oligopoly

- As the number of firms in the market increases,
  - the price effect becomes smaller
  - the oligopoly looks more and more like a competitive market
  - P approaches MC
  - the market quantity approaches the socially efficient quantity

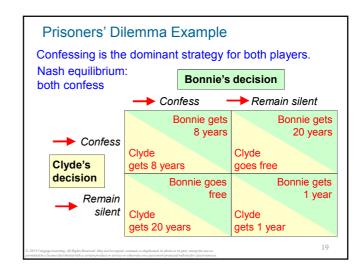

Another benefit of international trade: Trade increases the number of firms competing, increases **Q**, brings **P** closer to marginal cost Game Theory

- Game theory helps us understand oligopoly and other situations where "players" interact and behave strategically.
- Dominant strategy: a strategy that is best for a player in a game regardless of the strategies chosen by the other players
- Prisoners' dilemma: a "game" between two captured criminals that illustrates why cooperation is difficult even when it is mutually beneficial

7

### Prisoners' Dilemma Example

- The police have caught Bonnie and Clyde, two suspected bank robbers, but only have enough evidence to imprison each for 1 year.
- The police question each in separate rooms, offer each the following deal:
  - If you confess and implicate your partner, you go free.
  - If you do not confess but your partner implicates you, you get 20 years in prison.
  - If you both confess, each gets 8 years in prison.

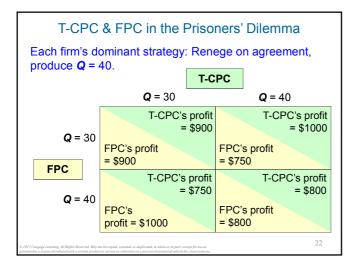

# Prisoners' Dilemma Example

- Outcome: Bonnie and Clyde both confess, each gets 8 years in prison.
- Both would have been better off if both remained silent.
- But even if Bonnie and Clyde had agreed before being caught to remain silent, the logic of selfinterest takes over and leads them to confess.

## Oligopolies as a Prisoners' Dilemma

- When oligopolies form a cartel in hopes of reaching the monopoly outcome, they become players in a prisoners' dilemma.
- Our earlier example:
  - T-CPC and FPC are duopolists in Daiwan.
  - The cartel outcome maximizes profits: Each firm agrees to serve **Q** = 30 customers.
- Here is the "payoff matrix" for this example...

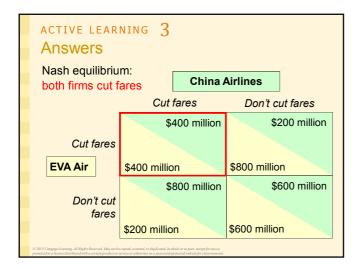

## ACTIVE LEARNING 3 The fare wars game The players: China Airlines and EVA Air

The choice: cut fares by 50% or leave fares alone

- If both airlines cut fares,
  - each airline's profit = \$400 million
- If neither airline cuts fares, each airline's profit = \$600 million
- If only one airline cuts its fares, its profit = \$800 million the other airline's profits = \$200 million

Draw the payoff matrix, find the Nash equilibrium.

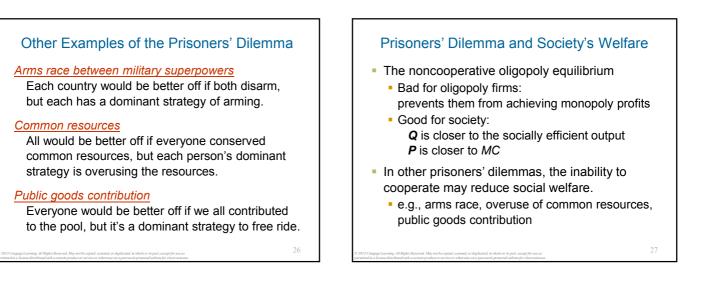

#### Other Examples of the Prisoners' Dilemma

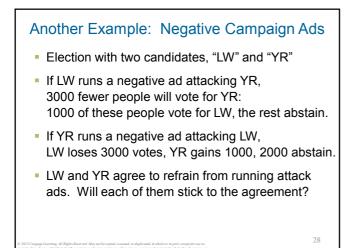

#### <u>Ad Wars</u>

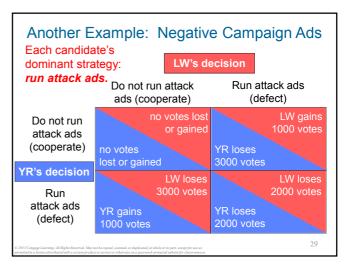

Two firms spend millions on TV ads to steal business from each other. Each firm's ad cancels out the effects of the other, and both firms' profits fall by the cost of the ads.

#### Organization of Petroleum Exporting Countries

Member countries try to act like a cartel, agree to limit oil production to boost prices and profits. But agreements sometimes break down when individual countries renege.

### Another Example: Negative Campaign Ads

- Nash eq'm: both candidates run attack ads.
- Effects on election outcome: NONE.
   Each side's ads cancel out the effects of the other side's ads.
- Effects on society: NEGATIVE.
   Lower voter turnout, higher apathy about politics, less voter scrutiny of elected officials' actions.

#### Why People Sometimes Cooperate

- When the game is repeated many times, cooperation may be possible.
- Two strategies that may lead to cooperation:
  - If your rival reneges in one round, you renege in all subsequent rounds.
     "Tit-for-tat"
  - Whatever your rival does in one round (whether renege or cooperate), you do in the following round.

## Public Policy Toward Oligopolies

- Recall one of the Ten Principles from Chapter 1: Governments can sometimes improve market outcomes.
- In oligopolies, production is too low and prices are too high, relative to the social optimum.
- Role for policymakers: Promote competition, prevent cooperation to move the oligopoly outcome closer to the efficient outcome.

## Restraint of Trade and Antitrust Laws

- Sherman Antitrust Act (1890): Forbids collusion between competitors
- Clayton Antitrust Act (1914): Strengthened rights of individuals damaged by anticompetitive arrangements between firms

#### **Controversies Over Antitrust Policy**

- Most people agree that price-fixing agreements among competitors should be illegal.
- Some economists are concerned that policymakers go too far when using antitrust laws to stifle business practices that are not necessarily harmful, and may have legitimate objectives.
- We consider three such practices...

34

- 1. Resale Price Maintenance ("Fair Trade")
- Occurs when a manufacturer imposes lower limits on the prices retailers can charge.
- Is often opposed because it appears to reduce competition at the retail level.
- Yet, any market power the manufacturer has is at the wholesale level; manufacturers do not gain from restricting competition at the retail level.
- The practice has a legitimate objective: preventing discount retailers from free-riding on the services provided by full-service retailers.

#### 2. Predatory Pricing

- Occurs when a firm cuts prices to prevent entry or drive a competitor out of the market, so that it can charge monopoly prices later.
- Illegal under antitrust laws, but hard for the courts to determine when a price cut is predatory and when it is competitive & beneficial to consumers.
- Many economists doubt that predatory pricing is a rational strategy:
  - It involves selling at a loss, which is extremely costly for the firm.
  - It can backfire.

#### 3. Tying

- Occurs when a manufacturer bundles two products together and sells them for one price (e.g., Microsoft including a browser with its operating system).
- Critics argue that tying gives firms more market power by connecting weak products to strong ones.
- Others counter that tying cannot change market power: Buyers are not willing to pay more for two goods together than for the goods separately.
- Firms may use tying for price discrimination, which is not illegal, and which sometimes increases economic efficiency.

### CONCLUSION

- Oligopolies can end up looking like monopolies or like competitive markets, depending on the number of firms and how cooperative they are.
- The prisoners' dilemma shows how difficult it is for firms to maintain cooperation, even when doing so is in their best interest.
- Policymakers use the antitrust laws to regulate oligopolists' behavior. The proper scope of these laws is the subject of ongoing controversy.

### Summary

- Oligopolists can maximize profits if they form a cartel and act like a monopolist.
- Yet, self-interest leads each oligopolist to a higher quantity and lower price than under the monopoly outcome.
- The larger the number of firms, the closer will be the quantity and price to the levels that would prevail under competition.

### Summary

- The prisoners' dilemma shows that self-interest can prevent people from cooperating, even when cooperation is in their mutual interest. The logic of the prisoners' dilemma applies in many situations.
- Policymakers use the antitrust laws to prevent oligopolies from engaging in anticompetitive behavior such as price-fixing. But the application of these laws is sometimes controversial.

### Oligopoly

- When there are only a few firms
- Firms care about each other's actions
  - Game Theory; Nash Equilibrium
  - Dominant Strategy; P.D.
- Collusion (Monopoly) vs. Self-Interest
- Policy: Increase competition; Antitrust Laws
- Homework: Mankiw, Ch. 17,

Problem 1, 2, 3, 6, 8, 9.

## Oligopoly

- True or False. The firms that sell personal computers have never banded together to form a cartel. We may infer from this that at least one firm would fail to benefit from a successful cartel.
- **True or False.** When all firms in an industry charge the same price, this is evidence of collusion.
