Unit 56 Extensions of the Root-Locus Method

Feng-Li Lian & Ming-Li Chiang NTU-EE Mar 2020 – Jul 2020

- For negative values of parameters
- Has a zero in the RHP (non-minimum phase)

$$\Rightarrow 1 + A (z_i - s) G'(s) = 0$$

$$\Rightarrow 1 + (-A) (s - z_i) G'(s) = 0$$

$$\Rightarrow 1 + K (s - z_i) G'(s) = 0$$

$$\Rightarrow K = -A <= 0$$

- For negative locus, the phase condition is:
 - The angle of L(s) is 0°+360°(I-1) for s on the negative locus
 - Hence, a Negative Locus is referred as a 0° Root Locus

- Rule 1: (as before)
- The n branches of the locus leave the poles of L(s) and
- m of these branches approach the zeros of L(s) and
- n m branches approach the asymptotes.
- Rule 2: (odd \rightarrow even)
- The locus is on the real axis to the left of an even number of real poles and zeros.
- Rule 3: $(180^{\circ} \rightarrow 0^{\circ})$

The asymptotes are described by:

$$\phi_{l} = \frac{0^{o} + 360^{o} (l - 1)}{n - m} \qquad l = 1, 2, \dots, n - m$$
$$\alpha = \frac{\sum p_{i} - \sum z_{i}}{n - m} = \frac{-a_{1} + b_{1}}{n - m}$$

- Rule 4: (180° → 0°)
- The angle of departure of a branch of the locus from repeated poles with multiplicity q is given by

$$q \phi_{l,dep} = \sum \psi_i - \sum_{i \neq l,dep} \phi_i - 0^o - 360^o (l-1)$$

 $l = 1, 2, \cdots, q$

The angle of arrival of a branch at a zero with multiplicity q is given by

$$q \psi_{l,arr} = \sum \phi_i - \sum_{i \neq l,arr} \psi_i + 0^o + 360^o (l-1)$$

- Rule 5:
- The locus can have multiple roots at points on the locus and the branches will approach a point of q roots at angles separated by $\frac{180^{o} - 360^{o}(l-1)}{2}$

\boldsymbol{q}

• And will depart at angles with same separation.

Rules for Plotting a Negative (0°) Root Locus

CS56-Extensions - 5 Feng-Li Lian © 2020

X

X

Example 5.13: Negative Root Locus for Airplane

$$G(s) = \frac{6-s}{s(s^2+4s+13)}$$
$$= -\frac{s-6}{s(s^2+4s+13)}$$
$$\Rightarrow 1 + K \frac{s-6}{s(s^2+4s+13)} = 0$$

Rule 1:

- There are 3 branches and 2 asymptotes.
- Rule 2:
- One real-axis segment to the right of s = 6 and
- A segment is to the left of s = 0.

Rules for Plotting a Negative (0°) Root Locus

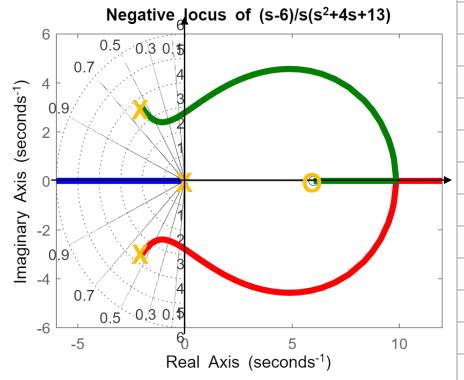

CS56-Extensions - 6 Feng-Li Lian © 2020

Example 5.13: Negative Root Locus for Airplane

The angles of asymptotes

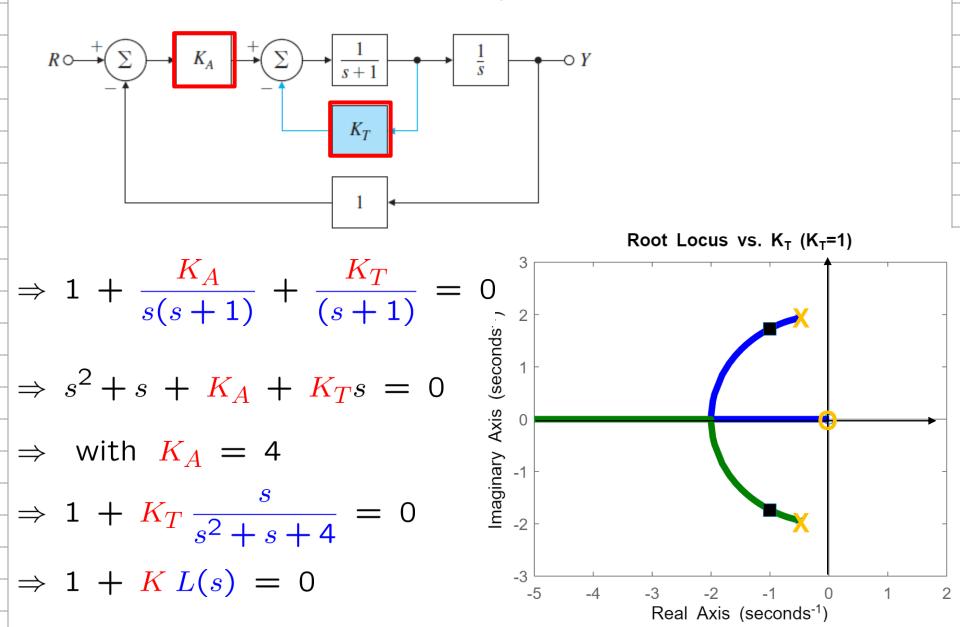

$$\phi_l = \frac{360^o(l-1)}{3-1} = 0^o, 180^o$$
$$\alpha = \frac{-2-2-(6)}{3-1} = -5$$

Departs at s = -2+j3 at $\phi = \tan^{-1}(\frac{3}{-8}) - \tan^{-1}(\frac{3}{-2}) - 90^{\circ} + 360^{\circ}(l-1)$ $= 159.4^{\circ} - 123.7^{\circ} - 90^{\circ} + 360^{\circ}(l-1)$ $= -54.3^{\circ}$

Consideration of Two Parameters
