Unit 3E Effects of Zeros and Additional Poles

Feng-Li Lian NTU-EE Sep 2021 – Jan 2022

CS3E-ZerosAddPoles - 2 Feng-Li Lian © 2021

Same Poles, Different Zeros

One zero at z = -1.1 cancels the effect of the pole at p = -1

Same Poles, Different Zeros

$$H(s) = \frac{\frac{s}{\alpha \zeta w_n} + 1}{(\frac{s}{w_n})^2 + 2\zeta(\frac{s}{w_n}) + 1}$$

• Zero:
$$s = -\alpha \zeta w_n = -\alpha \sigma$$

If α >> 1,

the zero will be far removed from the poles and the zero will have little effect on the response.

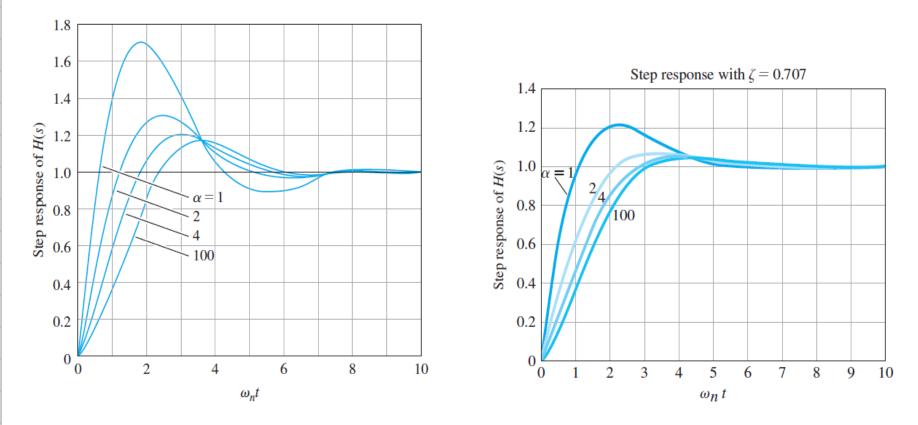

• If $\alpha == 1$,

the zero will have a substantial influence on the response.

CS3E-ZerosAddPoles - 4 Feng-Li Lian © 2021

Same Poles, Different Zeros

- Plots of the step response of a second-order system with a zero ($\zeta = 0.5$)
- Plots of the step response of a second-order system with a zero ($\zeta = 0.707$)

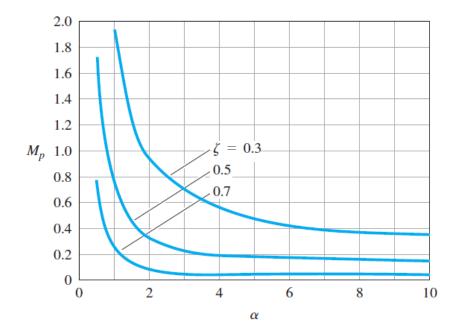

• Increase Overshoot M_p and reduce Rise Time t_r

Little influence on Settling Time t_s

CS3E-ZerosAddPoles - 5 Feng-Li Lian © 2021

Same Poles, Different Zeros

• Plot of Overshoot M_p as a function of normalized zero location α . At $\alpha = 1$, the real part of the zero equals the real part of the poles

CS3E-ZerosAddPoles - 6 Feng-Li Lian © 2021

Same Poles, Different Zeros

$$H(s) = \frac{\frac{s}{\alpha \zeta w_n} + 1}{(\frac{s}{w_n})^2 + 2\zeta(\frac{s}{w_n}) + 1}$$

By normalizing frequency

$$\Rightarrow H(s) = \frac{\frac{s}{\alpha\zeta} + 1}{s^2 + 2\zeta s + 1}$$

$$\tau \stackrel{\Delta}{=} w_n t$$

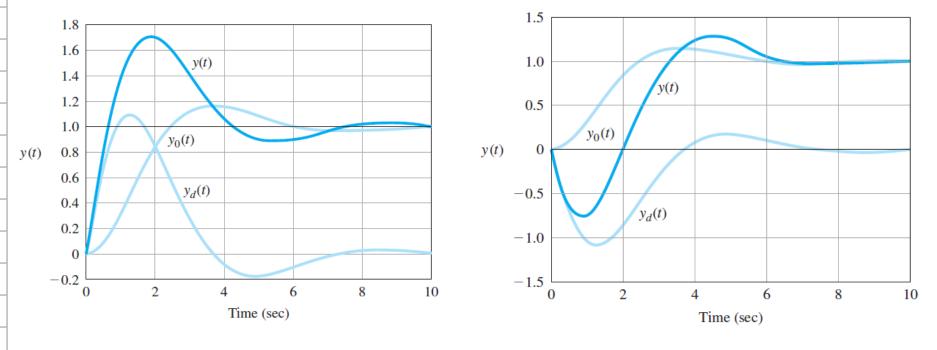

$$= \frac{1}{s^2 + 2\zeta s + 1} + \left(\frac{1}{\alpha\zeta}\right) \left(\frac{s}{s^2 + 2\zeta s + 1}\right)$$

$$\stackrel{\Delta}{=} H_0(s) + H_d(s)$$

$$\Rightarrow y(t) = y_0(t) + y_d(t) = y_0(t) + \frac{1}{\alpha\zeta} \dot{y}_0(t)$$

- Second-order step responses y(t)of the transfer functions H(s), $H_0(s)$, and $H_d(s)$
- Step responses y(t) of a second-order system with a zero in the RHP: a nonminimum-phase system

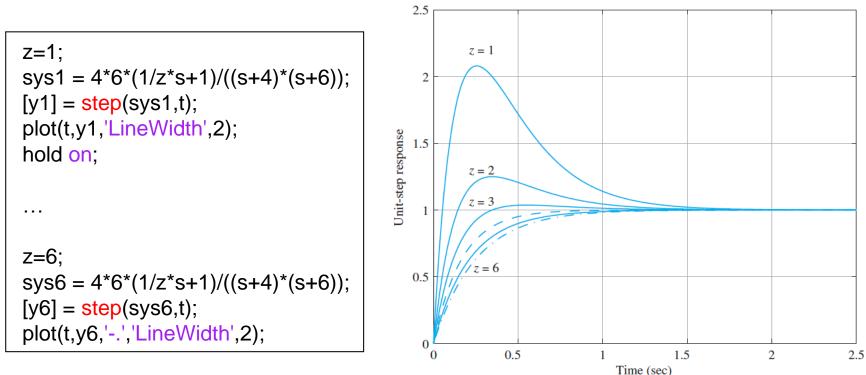

• Zero of $H_d(s)$ increase Overshoot M_p

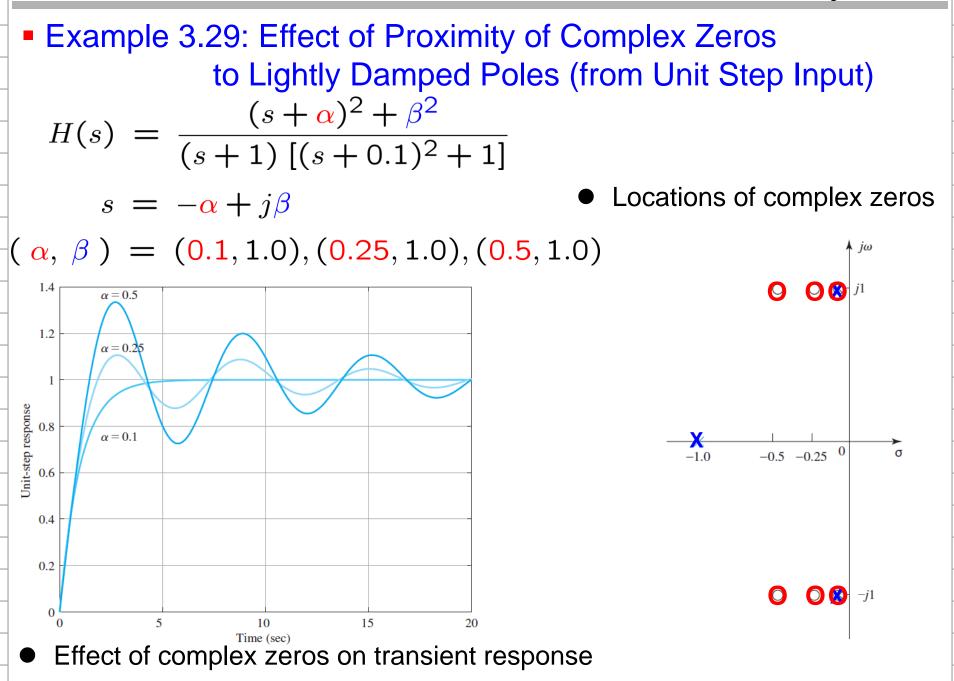

Example 3.28: Effect of Proximity of Zero to Pole Locations on the Transient Response (from Unit Step Input) $H(s) = \frac{24}{z} \frac{s+z}{(s+4)(s+6)}$ $z = \{1, 2, 3, 4, 5, 6\}$ $Y(s) = H(s)\frac{1}{s} = \frac{24}{z}\frac{s+z}{s(s+4)(s+6)}$ $= \frac{24}{z} \frac{s}{s(s+4)(s+6)} + \frac{24}{s(s+4)(s+6)}$ $y(t) = y_1(t) + y_2(t)$ $y_1(t) = \frac{12}{7} e^{-4t} - \frac{12}{7} e^{-6t}$ $y_2(t) = z \int_0^t y_1(\tau) d\tau = -3 e^{-4t} + 2 e^{-6t} + 1$ $y(t) = 1 + \left(\frac{12}{2} - 3\right) e^{-4t} + \left(2 - \frac{12}{2}\right) e^{-6t}$

Example 3.28: Effect of Proximity of Zero to Pole Locations on the Transient Response (from Unit Step Input)

• Effect of zero on transient response

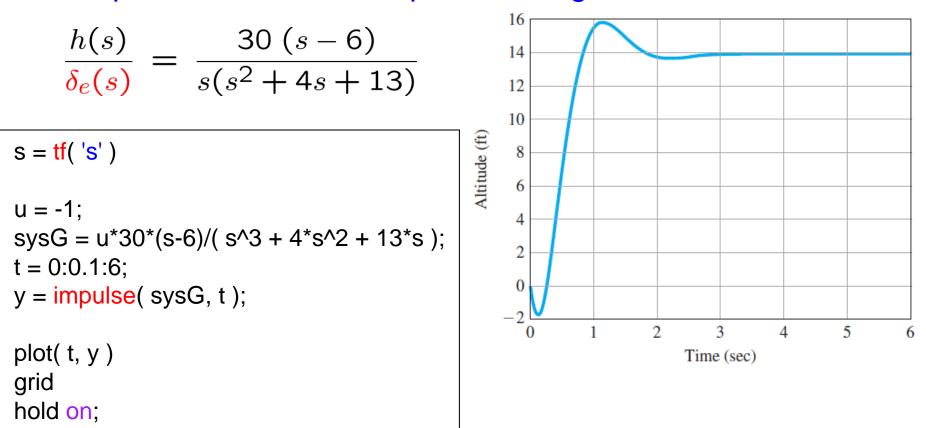

- Influence of zero on response overshoot
- z = 4 or z = 6: absent due to zero-pole cancelations
- z = 5: no overshoot

CS3E-ZerosAddPoles - 11 Feng-Li Lian © 2021

Example 3.30: Aircraft Response Using Matlab

Final Value:

$$\left. \frac{30 \ (s-6)(-1)}{s(s^2+4s+13)} \right|_{s=0} = \frac{30 \ (-6)(-1)}{13} = 13.8$$

Effects of Pole-Zero Patterns on Dynamic Response

$$H(s) = \frac{1}{(\frac{s}{\alpha \zeta w_n} + 1)[(\frac{s}{w_n})^2 + 2\zeta(\frac{s}{w_n}) + 1]}$$

- Step responses for several third-order systems with $\zeta = 0.5$
- Step responses for several third-order systems with $\zeta = 0.707$

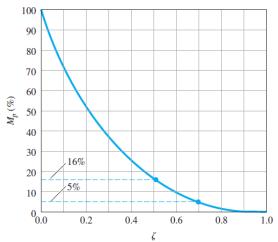

Summary of Effects of Zero and Extra Poles

CS3E-ZerosAddPoles - 14 Feng-Li Lian © 2021

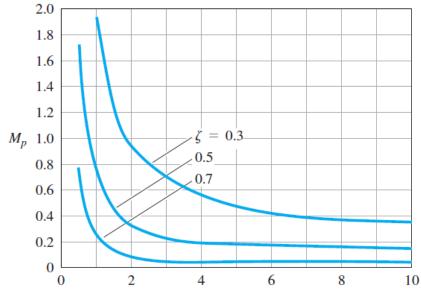

- Effects of Pole-Zero Patterns on Dynamic Response
- Rise time $t_r \Rightarrow t_r \cong \frac{1.8}{w_n}$
- Overshoot M_p $\Rightarrow M_p = \begin{cases} 5\%, & \zeta = 0.7 \\ 16\%, & \zeta = 0.5 \\ 35\%, & \zeta = 0.3 \end{cases}$

Settling time t_s

$$\Rightarrow t_s = rac{4.6}{\zeta w_n} = rac{4.6}{\sigma}$$

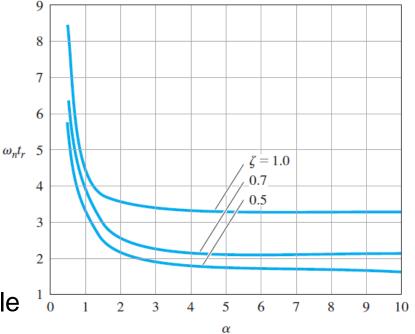

- Effects of Pole-Zero Patterns on Dynamic Response
- A zero in LHP will increase the overshoot
 - if the zero is within a factor of 4
 - of the real part of the complex poles.
- A zero in RHP will depress the overshoot.

Summary of Effects of Zero and Extra Poles

- CS3E-ZerosAddPoles 16 Feng-Li Lian © 2021
- Effects of Pole-Zero Patterns on Dynamic Response
- An additional pole in the LHP
 - will increase the rise time significantly
 - if the extra pole is within a factor of 4
 - of the real part of the complex poles.

 Normalized rise time for several locations of an additional pole
