Applying for Economics Graduate School

An Example of Signaling

Questions

- What should I apply? MBA or Econ PhD?
- What's the most important factor if I apply?
- Are foreigners/females discriminated against?
- Is mathematics needed in graduate school?
- Is MA (at NTU) required before I enter PhD?
- How should I prepare myself now?

What Program Should I Apply?

- MBA or Econ PhD?
- This depends on Your Career Interest
- However, MBA is NOT for “newly graduates”
 - MBA is designed for people who have worked for years and are heading for top management
 - They teach “undergraduate level Economics”, but
 - tie it with actual working experience
 - Socializing with other CEO-to-be's is a bonus

What Program Should I Apply?

- Econ PhD provides you the rigorous training to modern “economic analysis” techniques
- This is used by
 - Academics (Economics, Public Policy, Law, etc.)
 - Economics Consulting Firms
 - Public Policy Evaluation
 - Financial Companies (like Investment Banking)
 - International Organizations (APEC, IMF, etc.)

Most Important Factor

- What is the Most Important Factor when I Apply for Graduate School?
- Petersons Guide surveyed both students and admission committee members (faculty)
- They find that both agree No.1 factor is:
 - Letter from someone the committee knows
- Why is this No.1?
- Credible Signaling!

Most Important Factor

- No.1:
 - Letter from someone the committee knows
 - Who are the people committees know?
 - What if I cannot find someone to write?
 - Find Other “Credible Signals”!
 - GPA?
 - GRE or TOEFL?
 - Other Distinct Features?
- 

Discrimination and Gender

- Are Foreigners or Females Discriminated Against?
 - Foreigners:
 - Different Programs have different policy
 - UCLA (8/35) vs. MIT (25/30)
 - Women: Only 16% of the Faculty are Female
 - Does the market favor women? Maybe...
 - Comparison: 33% Math Professors are Female
- 

Is Mathematics Needed?

- Advice for Econ PhD Applicants:
 - Take a heavy dose of mathematics during undergraduate. ~ Peterson's Guide
 - So, the answer is generally “yes.”
 - There is a “gap” between undergrad & graduate...
 - However, the ability to find economic intuition behind the math is even more essential
 - My first year micro comp. experience...
 - They need Bilingual People!
- 

Is Mathematics Needed?

- What Kind of Math is Needed?
 - Advanced Calculus – Score 80 or higher
 - The thinking process required for you to score 80 is what's important
 - Linear Algebra – Basic Tool for Econometrics
 - Mathematical Statistics – Econometrics
 - The more the better, but mastering these three is better than being a jack of all traits...
- 

Is MA required before I enter PhD?

- No. Top-10 schools admit only PhD students.
 - Chicago: We'll give you a master if you can't finish.
 - However, you might not be able to survive studying both math & economics in English...
 - Hence, a MA might help since
 - MA classes are similar to PhD classes
 - You might not be sure if you want to go for PhD
 - Condition on passing 1st year comp's, MA is unnecessary, but you may want to hedge...
- 

How Should I Prepare Myself Now?

- Create Credible Signals!
 - Such As:
 - GPA 4.0
 - Good References
 - A Published Research Paper
 - Take a Heavy Dose of Mathematics
 - Take Graduate Level Courses in Economics
 - Take Economics Courses Taught in English
- 

Signaling

Joseph Tao-yi Wang
5/8/2008

What Makes a Signal Work?

- A Signal must be affordable by certain types of people
 - Cost < Benefit (if receivers “decodes” it)
- A signal must be too expensive for players of the wrong type to afford
 - Cost > Benefit (even if receivers “decodes” it)
- Separating Equilibrium: Those who buy and those who don't are of different types

What Makes a Signal Work?

- Separating Equilibrium consists of a circular argument:
 - Signal senders buy the signal anticipating receivers decode it
 - Receivers get assurance about sender types from the signal and act different with/without it
 - This is a self-fulfilling prophecy
- Spence (Dissertation 1974)

What Makes a Signal Work?

- Exercise: Show which types of people can afford the following signals:
 - GPA 4.0
 - Good References
 - A Published Research Paper
 - Take a Heavy Dose of Mathematics
 - Take Graduate Level Courses in Economics
 - Take Economics Courses Taught in English

Theory of Signaling

- Harsanyi (MS 1967-68)
 - Types: Privately observe a move of “Nature”
- Bayesian-Nash Equilibrium (multiple!)
 - Separating Equilibrium
 - Pooling Equilibrium
 - Semi-pooling Equilibrium
- Refinements: Sequential, Intuitive, Divine, Universal Divine, Never-Weak-BR, Stable

Simple Signaling Game

- Brandts and Holt (AER 1992)
- Worker Types are H or L with (2/3, 1/3)
- Seeing own type, Workers can choose to S (skip) or I (invest in education)
- Seeing this action, Employer assign the worker to a D (dull) or C (challenging) job
- Employer payoffs are 125 if she assigns D to L types and C to H types

Simple Signaling Game

- Workers get 100 doing C and 20 doing D
- L types get additional 40 for taking action S
- H types get 40 for taking action I, 20 for taking S

	Action seeing S		Action seeing I	
	C ^S	D ^I	C ^I	D ^S
Type L	140, 75	60, 125	100, 75	20, 125
Type H	120, 125	20, 75	140, 125	60, 75

Simple Signaling Game

- Two Pooling Equilibria:
 - Both Types choose S, Employers assign C
 - Out-of-equilibrium Belief: choosing I means L
 - Hence, Employers assign D if they see I
- Sequential Equilibrium
 - Both Types choose S, Employers assign C
 - Out-of-equilibrium Belief: choosing I means L
 - Hence, Employers assign D if they see I
- Intuitive Equilibrium
 - Both Types choose I, Employers assign C
 - Out-of-equilibrium Belief: choosing S means L
 - Hence, Employers assign D if they see S

Simple Signaling Game

Periods	Message Type		Action Type		Equilibrium Predictions	
	I H	I L	C I	D S	Intuit.	Seq.
1-4	100	25	100	74	100	0
5-8	100	58	100	100	100	0
9-12	100	75	98	60	100	0
Suggest Actions: "C S, D I"						
1-4	50	13	60	46	100	0
5-8	75	33	33	67	100	0

Follow-up Studies

- Banks, Camerer and Porter (GEB 1994)
- Design 7 games, separating:
 - Nash vs. non-Nash
 - Sequential vs. Nash
 - Intuitive vs. Sequential
 - Divine vs. Intuitive
 - Universal Divine vs. Divine
 - NWBR vs. Universal Divine
 - Stable vs. NWBR

Follow-up Studies

- Results show that subjects do converge to the more refined equilibrium up to intuitive
- After that, subjects conform to neither
 - Except for possibly Stable vs. NWBR
- Is this a test of refinements, or a test of equilibrium selection?
- Exercise: Show how equilibria in Table 8.3 (BCP94') satisfy corresponding refinements

Follow-up Studies

- In game 2-6, different types send different messages
 - No simple decision rule explains this
 - But weak dominance and 1 round IEDS hold
- Are people just level-1?
- Also, how does the convergence work?

Follow-up Studies

- More studies on learning:
- Brands and Holt (IJGT 1993)
 - Subjects lead to play less refined equilibrium
 - Why? Initial random play produces history that supports the non-intuitive equilibrium
- Anderson and Camerer (ET 2000)
 - EWA yields $\delta=0.54$ (0.05); does better than choice reinforcement ($\delta=0$) & weighted fictitious play ($\delta=1$)

Specialized Signaling Games

- Potters and van Winden (IJGT 1996)
 - Lobbying
- Cadsby, Frank & Maksimovic (RFS 1990)
 - Corporate Finance
- Cooper, Kagel, Lo and Gu (AER 1999)
 - Ratchet Effect
- Cooper, Garvin and Kagel (Rand/EJ 1997)
 - Belief Learning in Limit Pricing Signaling Games

Lobbying:

Potters & van Winden (IJGT 1996)

- Lobby group is type t_1 or t_2 with $(1-p, p)$
- Lobby group can send a signal (cost c)
- Politician chooses action x_1 or x_2 (match type)

Type	No signal		Costly Signal	
	x_1	x_2	x_1	x_2
$t_1 (1-p)$	0, b_1	$a_1, 0$	$-c, b_1$	$a_1 - c, 0$
$t_2 (p)$	0, 0	a_2, b_2	$-c, 0$	$a_2 - c, b_2$

Lobbying

- For $\beta = \frac{pb_2}{(1-p)b_1} < 1$; there are 2 equilibrium:
- Pooling: Lobby groups both don't send signal
- Politician ignores signal and chooses x_1
 - Intuitive, divine, but not universally divine
- Semi-pooling: type t_2 always send signal
- Politicians mix x_1, x_2 with $(1-c/a_1, c/a_1)$ if signal
- type t_1 mixes by sending signal with prob. β
 - Universally divine

Lobbying

Treat ment	Signal Freq. β	Freq. (t_1, t_2)		c/a_1	Freq. (no sig., sig)	
		Actual	Pred.		Actual	Pred.
1	0.25	38, 76	25,100	0.25	2, 5	0,25
2(2c)	0.75	46,100	75,100	0.25	3, 79	0,25
2a(6c)	0.75	83, 93	75,100	0.25	11, 54	0,25
3	0.25	16, 85	25,100	0.75	0, 53	0,75
4	0.75	22, 83	75,100	0.75	5, 80	0,75
Aver.	0.25	27, 81	25,100	0.25	5, 46	0,25
	0.75	50, 92	75,100	0.75	2, 66	0,75

Lobbying

- Supporting universally divine equilibrium
- Fictitious Play Learning:
 - Past frequency of x_2 after signal is $r(m)_{t,1}$
- Should signal if $r(m)_{t,1} a_1 - c > 0$
 - Subjects signal 46% if >0 , 28% if <0
 - Politicians choose x_2 77% if >0 , 37% if <0
- Potters and van Winden (JEBO 2000)
 - Similar results; little difference between students and professionals

Corporate Finance

- Cadsby, Frank & Maksimovic (RFS 1990)
- Firms are either H or L with $(\frac{1}{2}, \frac{1}{2})$
 - Worth B_H, B_L if carry project; worth A_H, A_L if pass
- Need capital I to finance the project
- Investors can put up I and get S shares
- Exercise: When will there be pooling, separating, and semi-separating equilibria?

Corporate Finance

- Example:
- L types worth 375, 50 (with/without project)
- H types worth 625, 200 (with/without project)
- Capital $I = 300$
- Separating equilibrium: $S=0.80$
- Pooling equilibrium: $S=0.60$
- Semi-pooling equilibrium: $S=0.68$
- Exercise: Show that these are equilibria!

Corporate Finance

- Cadsby et al. ran 10 sessions (Table 8.11)
- Results support equilibrium (pooling if multi.)
 - When unique pooling: all firms offer shares
 - When unique separating: Initially, both offer (pool), but H types learn not to offer (separate)
 - When multiple: Converge to pooling equilibrium
- Cadsby, Frank and Maksimovic (RFS 1998)
 - Add costly signals (see Table 8.12 for results)

Ratchet Effect

- Cooper, Kagel, Lo and Gu (AER 1999)
- Firms are either H or L with $(\frac{1}{2}, \frac{1}{2})$
- Choose output level 1~7
- Planner choose “easy” or “tough” target
 - Set “easy” if $P(L | \text{output}) > 0.325$
- Pooling Eq: L chooses 1 or 2; H pools with L
- Myopic K firms: Naively pick 5 (& get “tough”)
 - Exercise: Prove these with payoffs in Table 8.13.

Ratchet Effect

- 70~90% L firms choose 2
- Most H firms choose 2 or 5
- Period 1-12: 54-76% myopic → 80% tough
- Period 13-36: Convergence to pooling
- Big context effect only for Chinese manager
 - Provides language to foster learning from exp.
- Cooper, Garvin and Kagel (Rand/EJ 1997)
 - Belief Learning in Limit Pricing Signaling Games

Reputation Formation

- Camerer and Weigelt (Econometrica 1988)
- 8 period trust game
- Borrower: “normal” (X) or “nice” (Y)
- (New) Lender each period: Lend or Don't
- Borrower chooses to Default or Repay
 - Normal types default; nice types repay

Reputation Formation

Lender Strategy	Borrower Strategy	Lender Payoff	Borrower Payoff	
			Normal	Nice (Y)
Lend	Default	-100	150	0
	Repay	40	60	60
Don't	-	10	10	10

Reputation Formation

- What does the equilibrium look like?

Conditional Frequency of Lending

Round		1	2	3	4	5	6	7	8
3-5	Predict	100	100	100	100	64	64	64	64
	Actual								
6-8	Predict	100	100	100	64	64	64	64	64
	Actual								
9-10	Predict	100	100	100	64	64	64	64	64
	Actual								

Conditional Frequency of Lending

Round		1	2	3	4	5	6	7	8
3-5	Predict	100	100	100	100	64	64	64	64
	Actual	94	96	96	91	72	59	38*	67
6-8	Predict	100	100	100	64	64	64	64	64
	Actual	96	99	100	95*	85*	72	58	47
9-10	Predict	100	100	100	64	64	64	64	64
	Actual	93	92	83	70	63	72	77	33

Conditional Frequency of Repay (by X)

Round		1	2	3	4	5	6	7	8
3-5	Predict	100	100	100	81	65	59	44	0
	Actual								
6-8	Predict	100	100	73	68	58	53	40	0
	Actual								
9-10	Predict	100	100	73	67	63	56	42	0
	Actual								

Conditional Frequency of Repay (by X)

Round		1	2	3	4	5	6	7	8
3-5	Predict	100	100	100	81	65	59	44	0
	Actual	95	97	98	95*	86*	72	47	14
6-8	Predict	100	100	73	68	58	53	40	0
	Actual	97	95	97*	92*	85*	70*	48	0
9-10	Predict	100	100	73	67	63	56	42	0
	Actual	91	89	80	77	84*	79*	48	29

Follow-up Studies

- Neral and Ochs (Econometrica 1992)
 - Similar repeated trust games
- Jung, Kagel and Levin (Rand 1994)
 - Entry deterrence in “chain-store paradox”
- Camerer, Ho and Chong (JET 2002)
 - Sophisticated EWA (strategic teaching!)

Conclusion

- Cooper, Garvin and Kagel (EJ 1997)
 - “We do not suggest that game theory be abandoned, but rather as a descriptive model that it needs to incorporate more fully how people actually behave.”
- Possible improvements:
- QRE, level-k or Cognitive Hierarchy
- Learning (EWA or belief learning)
