CHAPTER 4

The Market Forces of Supply and Demand

Markets and Competition

- Market
  - A group of buyers and sellers of a particular good or service
  - Buyers as a group
    - Determine the demand for the product
  - Sellers as a group
    - Determine the supply of the product

Markets/Competition: In modern economics:

- A market is a group of buyers and sellers of a particular product trading under certain rules.
- A competitive market is one where buyers and sellers have a negligible effect on price because there are substitutes on either side.
- A perfectly competitive market is where there are perfect substitutes for both buyers and sellers so you can always switch
- No one can affect market price - each is a price taker since others can always switch

Demand

- Quantity demanded
  - Amount of a good that buyers are willing and able to purchase
- Law of demand
  - Other things equal
  - When the price of a good rises, the quantity demanded of the good falls
  - When the price falls, the quantity demanded rises

Look for the answers to these questions

- What factors affect buyers’ demand for goods?
- What factors affect sellers’ supply of goods?
- How do supply and demand determine the price of a good and the quantity sold?
- How do changes in the factors that affect demand or supply affect the market price and quantity of a good?
- How do markets allocate resources?
Sam's Demand Schedule

Demand schedule:
- A table, shows the relationship between the price of a good and the quantity demanded.
- Example: Sam's demand for lattes.
- Notice that Sam's preferences obey the law of demand.

Market Demand

- Market demand
  - Sum of all individual demands for a good or service.
  - Market demand curve: sum the individual demand curves horizontally.
    - To find the total quantity demanded at any price, we add the individual quantities.

Market Demand versus Individual Demand

Suppose Sam and Dean are the only two buyers in the market for lattes. (Q^d = quantity demanded)

<table>

Demand Curve Shifters

- The demand curve
  - Shows how price affects quantity demanded, other things being equal.
- These "other things" are non-price determinants of demand
  - Things that determine buyers' demand for a good, other than the good's price.
- Changes in them shift the D curve...
Demand Curve Shifters

• Number of buyers
  – Increase in # of buyers
    • Increases quantity demanded at each price
    • Shifts D curve to the right
  – Decrease in # of buyers
    • Decreases quantity demanded at each price
    • Shifts D curve to the left

Demand Curve Shifters

• Income
  – Normal good, other things constant
    • An increase in income leads to an increase in demand: Shifts D curve to the right
  – Inferior good, other things constant
    • An increase in income leads to a decrease in demand: Shifts D curve to the left

Demand Curve Shifters

• Prices of related goods, substitutes
  – Two goods are substitutes if
    • An increase in the price of one leads to an increase in the demand for the other
  – Example: pizza and hamburgers
    • An increase in the price of pizza increases demand for hamburgers, shifting hamburger demand curve to the right
  – Other examples: Coke and Pepsi, laptops and tablets, music CDs and music downloads

Demand Curve Shifters

• Prices of related goods, complements
  – Two goods are complements if
    • An increase in the price of one leads to a decrease in the demand for the other
  – Example: computers and software
    • If price of computers rises, people buy fewer computers, and therefore less software; Software demand curve shifts left
  – Other examples: College tuition and textbooks, bagels and cream cheese, eggs and bacon

Demand Curve Shifters

• Tastes
  – Anything that causes a shift in tastes toward a good will increase demand for that good and shift its D curve to the right
  – Example:
    • Fresh milk became popular in Taiwan after powder was hit by the Melamine (三聚氰胺) incident, caused an increase in demand for fresh milk, shifted the fresh milk demand curve to the right.

Demand Curve Shifters: # of Buyers

Suppose the number of buyers increases. Then, at each P, Q^2 will increase (by 5 in this example).
Demand Curve Shifters

- Expectations about the future
  - Expect an increase in income, increase in current demand
  - Expect higher prices, increase in current demand
  - Example: If people expect their incomes to rise, their demand for meals at expensive restaurants may increase now
  - In the news: Vegetable price before/after typhoons

Active Learning 1

- Draw a demand curve for iPad Pro
- What happens to it in each of the following scenarios?
- Why?

A. The price of Apple Pencil falls
B. The price of iPad Pro falls
C. The price of Surface Pro 4 falls

Active Learning 1

A. Price of Apple Pencil falls

iPad Pro and Apple Pencil are complements. A fall in price of Apple Pencil shifts the demand curve for iPad Pro to the right.

B. The price of iPad Pro falls

The D curve does not shift. Move down along curve to a point with lower P, higher Q.
**Active Learning 1: The price of Surface Pro 4 falls**

Surface Pro 4 and iPad Pro are substitutes. A fall in the price of Surface Pro 4 shifts demand for iPad Pro to the left.

**Supply**

- **Quantity supplied**
  - Amount of a good
  - Sellers are willing and able to sell
- **Law of supply**
  - Other things equal
  - When the price of a good rises, the quantity supplied of the good rises
  - When the price falls, the quantity supplied falls

**Starbucks’ Supply Schedule**

Supply schedule:
- A table, shows the relationship between the price of a good and the quantity supplied.
- Example: Starbucks’ supply of lattes
- Notice that Starbucks’ supply schedule obeys the law of supply

**Market Supply vs. Individual Supply**

The Market Supply Curve

Supply Curve Shifters

- The supply curve
  - Shows how price affects quantity supplied, other things being equal
- These "other things"
  - Are non-price determinants of supply
- Changes in them shift the S curve...

Supply Curve Shifters: Input Prices

Suppose the price of milk falls. At each price, the quantity of lattes supplied will increase (by 5 in this example).

Supply Curve Shifters

- Input prices
  - Supply is negatively related to prices of inputs
  - Examples of input prices: wages, prices of raw materials
  - A fall in input prices makes production more profitable at each output price
    - Firms supply a larger quantity at each price
    - The S curve shifts to the right

Supply Curve Shifters

- Technology
  - Determines how much inputs are required to produce a unit of output
  - A cost-saving technological improvement has the same effect as a fall in input prices, shifts S curve to the right
- Number of sellers
  - An increase in the number of sellers
    - Increases the quantity supplied at each price
    - Shifts S curve to the right

Supply Curve Shifters

- Expectations about future
  - Example: Events in the Middle East lead to expectations of higher oil prices
    - Owners of Texas oilfields reduce supply now, save some inventory to sell later at the higher price
    - S curve shifts left
  - Sellers may adjust supply* when their expectations of future prices change (If good not perishable)
Which change is driven by expectation of supply/demand?

Supply and Demand

Active Learning 2

Draw a supply curve for photo editing software. What happens to it in each of the following scenarios?

A. Retailers cut the price of the software.

B. A technological advance allows the software to be produced at lower cost.

C. Professional photo shops raise the price of the services they provide.

Active Learning 2

B. Fall in cost of producing software

S curve shifts to the right: at each price, Q increases.

Active Learning 2

C. Professional photo shops raise their price

Trick question: This shifts the demand curve for photo editing software, not the supply curve.

Active Learning 2

Supply curve

A. Fall in price of photo editing software

S curve does not shift. Move down along the curve to a lower P and lower Q.

Supply and Demand Together

Equilibrium:
Price has reached the level where quantity supplied equals quantity demanded.

Supply and Demand Together

Equilibrium price: price where Q supplied = Q demanded
Equilibrium quantity: Q supplied and demanded at the equilibrium price.

ASK THE EXPERTS

Price Gouging

“Connecticut should pass its Senate Bill 60, which states that during a ‘severe weather event emergency, no person within the chain of distribution of consumer goods and services shall sell or offer to sell consumer goods or services for a price that is unconscionably excessive.’”

What do economists say?
7% agree
16% uncertain
77% disagree

Markets Not in Equilibrium: Surplus

Surplus (excess supply): quantity supplied is greater than quantity demanded.
Example: if P = $5, then Q^D = 9 lattes and Q^S = 25 lattes
resulting in a surplus of 16 lattes.

Markets Not in Equilibrium: Surplus

Facing a surplus, sellers try to increase sales by cutting price.
This causes Q^D to rise and Q^S to fall...
...which reduces the surplus.

Markets Not in Equilibrium: Surplus

Facing a surplus, sellers try to increase sales by cutting price.
This causes Q^D to rise and Q^S to fall...
Prices continue to fall until market reaches equilibrium.
EXAMPLE: The Market for Hybrid Cars

EVENT TO BE ANALYZED: Increase in the price of gas.

STEP 1: D curve shifts because price of gas affects demand for hybrids. (S curve does not shift, because price of gas does not affect cost of producing hybrids)

STEP 2: D shifts right because high gas price makes hybrids more attractive relative to other cars.

STEP 3: The shift causes an increase in price and quantity of hybrid cars.
Shift vs. Movement Along Curve

- **Change in supply:**
  - A shift in the S curve
  - Occurs when a non-price determinant of supply changes (like technology or costs)
- **Change in the quantity supplied:**
  - A movement along a fixed S curve
  - Occurs when P changes

### EXAMPLE 2: A Shift in Supply

**EVENT:** New technology reduces cost of producing hybrid cars.

**STEP 1:** S curve shifts because event affects cost of production. (D curve does not shift, because production technology is not one of the factors that affect demand)

**STEP 2:** S shifts right because event reduces cost, makes production more profitable at any given price.

**STEP 3:** The shift causes price to fall and quantity to rise.

### EXAMPLE 3: A Shift in Both Supply and Demand

**EVENTS:** Price of gas rises AND new technology reduces production costs

**STEP 1:** Both curves shift.

**STEP 2:** Both shift to the right.

**STEP 3:** Q rises, but the effect on P is ambiguous:

If demand increases more than supply, P rises.

**Active Learning 3**

Shifts in Supply and Demand

Use the three-step method to analyze the effects of each event on the equilibrium price and quantity of iPad Pro.

**Event A:** A fall in the price of Surface Pro 4

**Event B:** Apple Inc. negotiate a reduction in the price they must pay Foxconn for each iPad Pro they assemble.

**Event C:** Events A and B both occur.
Active Learning 3  A. Fall in the price of Surface Pro 4

**STEPS:**
1. $D$ curve shifts
2. $D$ curve shifts left
3. $P$ and $Q$ both fall

![Diagram](image-url)

Active Learning 3  B. Fall in assemble cost

**STEPS:**
1. $S$ curve shifts (Assemble costs are part of sellers' costs)
2. $S$ curve shifts right
3. $P$ falls, $Q$ rises

![Diagram](image-url)

Active Learning 3  C. Fall in price of Surface Pro 4 and fall in assemble cost

**STEPS:**
1. Both curves shift (see parts A & B)
2. $D$ shifts left, $S$ shifts right
3. $P$ falls.
   - Effect on $Q$ is ambiguous:
   - The fall in demand reduces $Q$,
   - The increase in supply increases $Q$.

How Prices Allocate Resources

• "Markets are usually a good way to organize economic activity"
• In market economies
  – Prices adjust to balance supply and demand
• These equilibrium prices
  – Are the signals that guide economic decisions and thereby allocate scarce resources

Summary

• Economists use the model of supply and demand to analyze competitive markets.
  – Many buyers and sellers, all are price takers
• The demand curve shows how the quantity of a good demanded depends on the price.
  – Law of demand: as the price of a good falls, the quantity demanded rises; the $D$ curve slopes downward
  – Other determinants of demand: income, prices of substitutes and complements, tastes, expectations, and number of buyers.
  – If one of these factors changes, the $D$ curve shifts
• The supply curve shows how the quantity of a good supplied depends on the price.
  – Law of supply: as the price of a good rises, the quantity supplied rises; the $S$ curve slopes upward.
• Other determinants of supply: input prices, technology, expectations, and number of sellers.
  – If one of these factors changes, supply curve shifts.
• The intersection of the supply and demand curves determines the market equilibrium.
  – At the equilibrium price, quantity demanded = quantity supplied

Summary

• The supply curve shows how the quantity of a good supplied depends on the price.
  – Law of supply: as the price of a good rises, the quantity supplied rises; the $S$ curve slopes upward.
• Other determinants of supply: input prices, technology, expectations, and number of sellers.
  – If one of these factors changes, supply curve shifts.
• The intersection of the supply and demand curves determines the market equilibrium.
  – At the equilibrium price, quantity demanded = quantity supplied
Summary

• The behavior of buyers and sellers naturally drives markets toward their equilibrium.
  – When the market price is above the equilibrium price, there is a surplus of the good, which causes the market price to fall.
  – When the market price is below the equilibrium price, there is a shortage, which causes the market price to rise.

Summary

• To analyze how any event influences a market, we use the supply-and-demand diagram to examine how the event affects the equilibrium price and quantity.
  1. Decide whether the event shifts the supply curve or the demand curve (or both).
  2. Decide in which direction the curve shifts.
  3. Compare the new equilibrium with the initial one.

• In market economies, prices are the signals that guide economic decisions and thereby allocate scarce resources.

Chapter 4: Additional Homework Questions

- True or False. If the demand for lettuce falls, the price will fall, causing the demand to go back up.
- True or False. Suppose the enrollment at your university unexpectedly declines. Then the apartment owners in the area will face higher vacancy rates and might raise their rents to compensate.
- True or False. The discovery of a new method of birth control that is safer, cheaper, more effective, and easier to use than any other method would reduce the number of unwanted pregnancies.
