## P2P Papers

- Salman A. Baset and Henning Schulzrinne. An Analysis of the Skype Peer-to-Peer Internet Telephony Protocol. In Proceedings of IEEE Infocom 2006.
- Kuan-Ta Chen, Chun-Ying Huang, Polly Huang, and Chin-Laung Lei. Quantifying Skype User Satisfaction. In Proceedings of ACM SIGCOMM 2006.
- X. Zhang, J. Liu, B. Li, and T.-S. P. Yum. CoolStreaming/DONet: A Data-driven Overlay Network for Efficient Live Media Streaming. In Proceedings of IEEE INFOCOM 2005
- Meng-Ting Lu, Jui-Chieh Wu, Kuan-Jen Peng, Polly Huang, Jason J. Yao, Homer H. Chen. Design and Evaluation of a P2P IPTV System for Heterogeneous Networks. IEEE Transactions on Multimedia, Vol. 9, No. 8, pp. 1568-1579, Dec. 2007

Polly @ NTU Copyright © 2008 2

# Multimedia P2P

**Skype**  
CoolStreaming  
HotStreaming

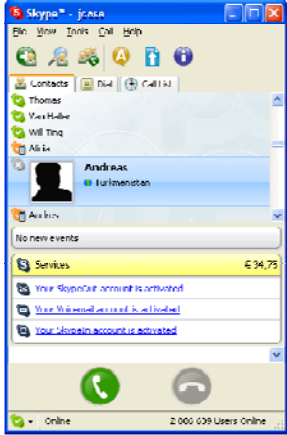

Polly @ NTU Copyright © 2008 3

Polly @ NTU Copyright © 2008 4

## What is it?

- A peer-to-peer (P2P) overlay network for VoIP
- By the KaZaA developers
- To an average user, it is an Instant Messaging system that supports instant voice

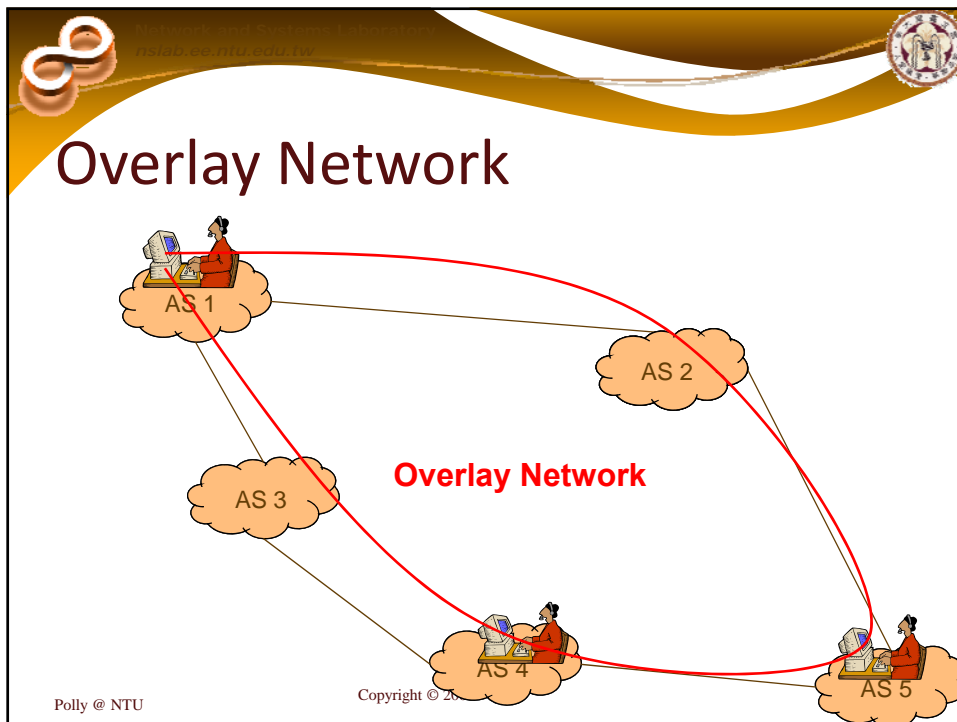

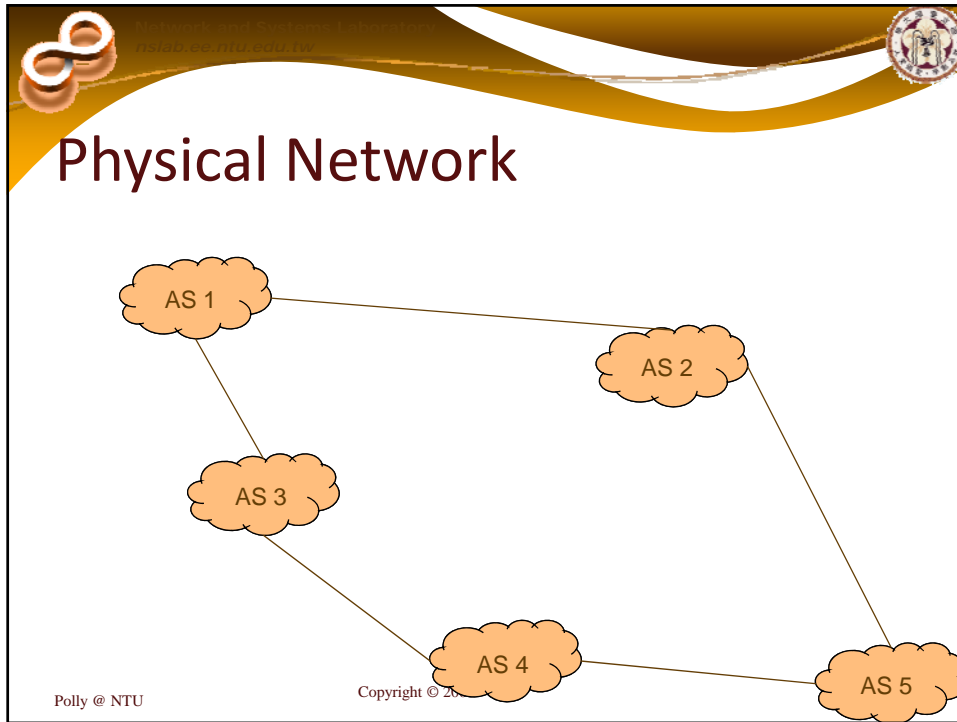

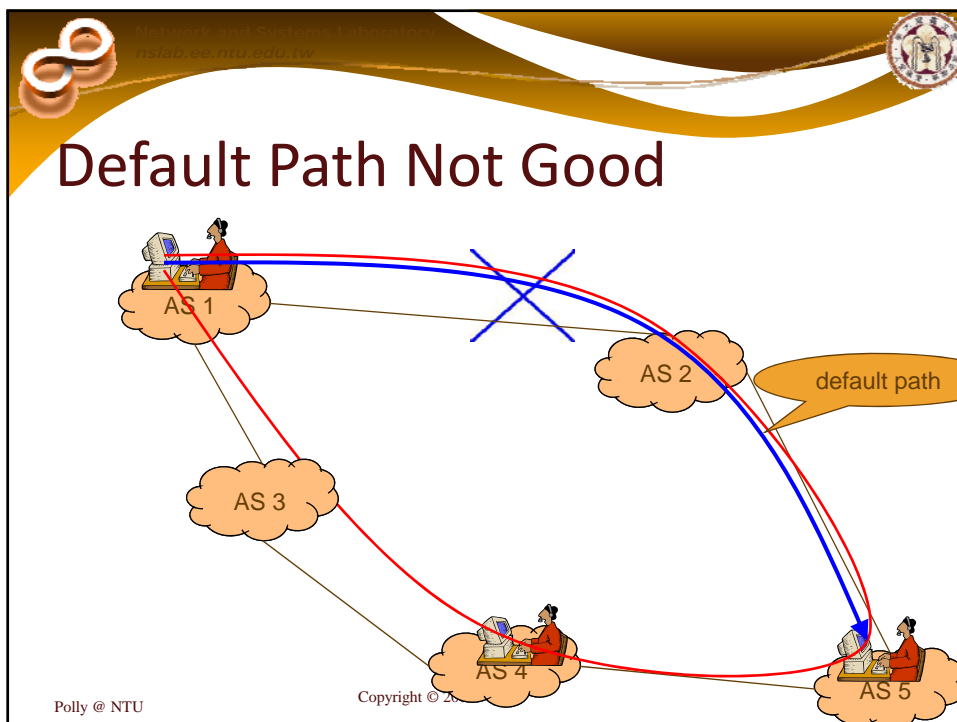

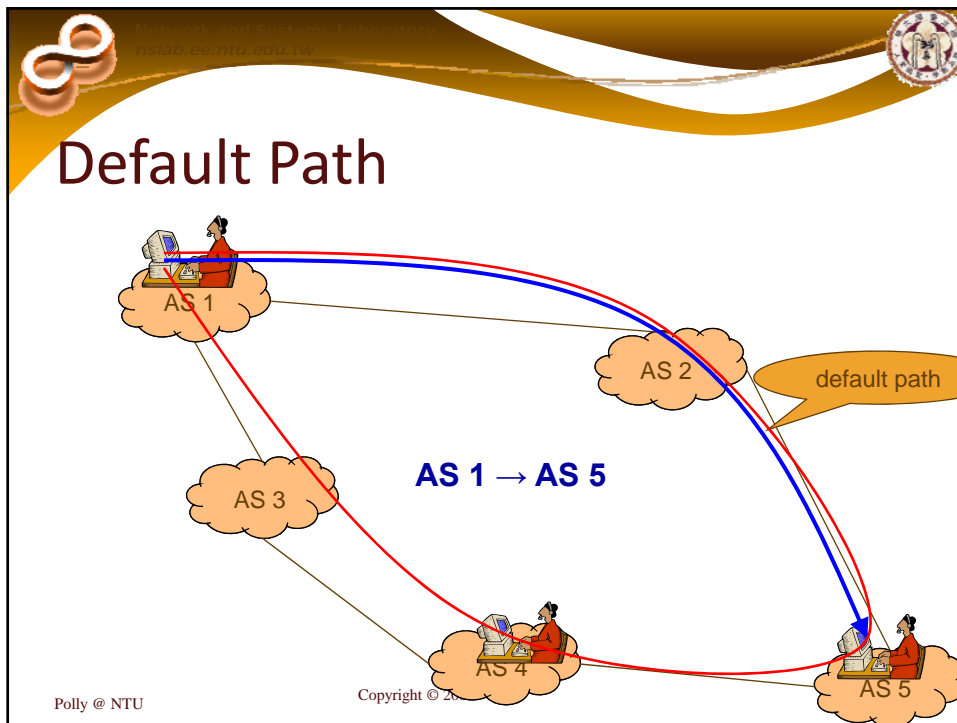

Polly @ NTU Copyright © 2008 5

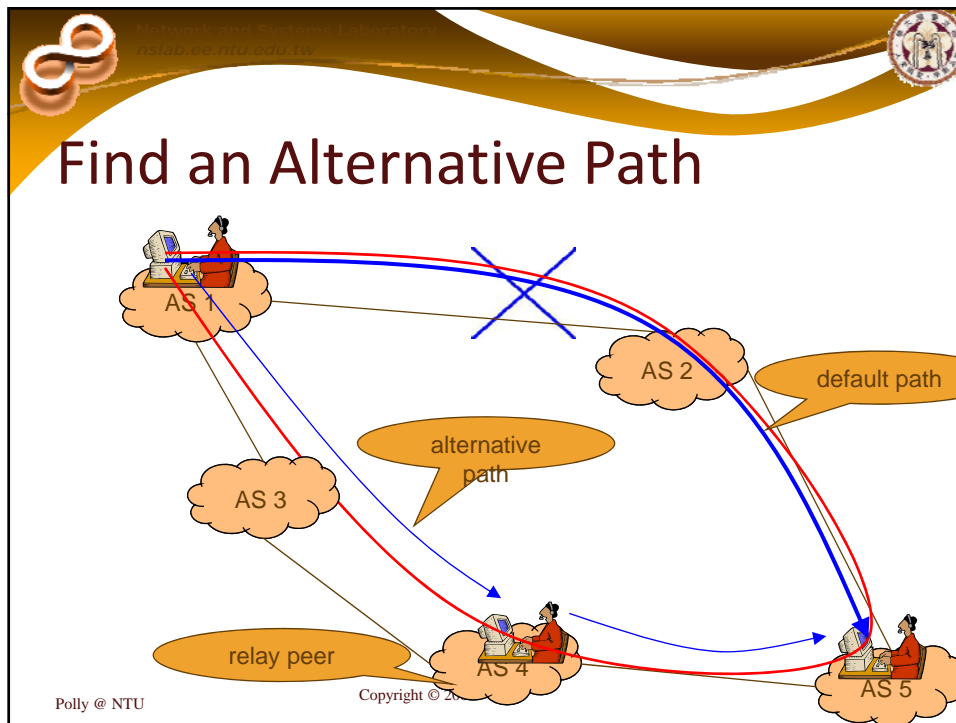

## Secret of Success

- Codec (provided by Global IP Sound)
  - 67 bytes packet payload
  - 24 to 120 kbps
- NAT and firewall traversal
- **Alternative paths!**

Polly @ NTU Copyright © 2008 6

## Based on KaZaA

- A hybrid solution
  - Some are group leaders
    - Super nodes or SN
  - Most are ordinary peers
    - Ordinary nodes or ON
- 1st level
  - Between a group leader and its ordinary peers
  - Napster-like
- 2nd level
  - Between group leaders
  - Gnutella-like

● ordinary peer  
 ● group-leader peer  
 — neighboring relationships in overlay network

Copyright © 2008

## Phase I: Login

- Send 'I'm alive' to other peers
  - Showing in your friends' Friend lists
- Determines the type of NAT and firewall it is behind
  - More details if time allow
- **Discover online SNs**

Polly @ NTU Copyright © 2008 13

## Where are the SNs?

- 1st-time use of Skype
  - Connect first to a **bootstrap** server to acquire a candidate SN list
  - Select one from the list
  - Report to the SN meta data about user/files to be shared
  - Acquire from the SN the updated list of candidate SN
  - Cache the candidate SN list
- 2nd-time+ use of Skype
  - Select one from the cached candidate SN list
  - The rest is the same

Polly @ NTU Copyright © 2008 14

## Phase II: Address Lookup

- Initiator calling target
  - Calling pollyhuang...
  - Where is pollyhuang at?
- Username  $\rightarrow$  (IP, port) address mapping
  - The meta data about users stored in SNs

Polly @ NTU Copyright © 2008 15

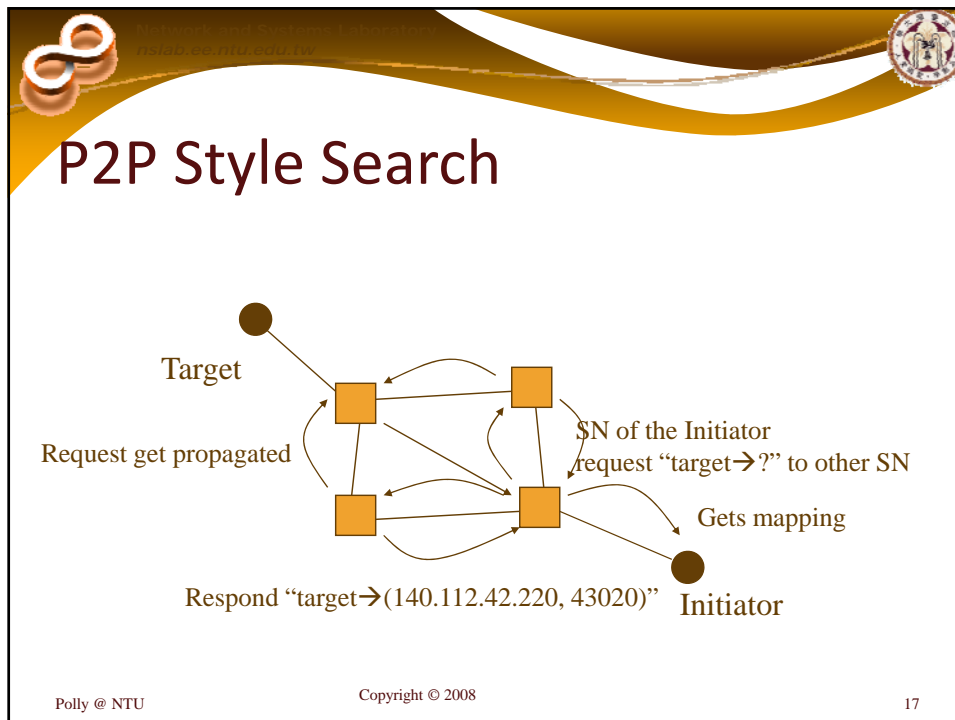

## Address Lookup Service

When target logs on, send mapping to SN  
send "target  $\rightarrow$  (140.112.42.220, 43020)"

When initiator makes call  
Request "target  $\rightarrow$  ?" to SN

Polly @ NTU Copyright © 2008 16

## The Operation

- Probe a list of nodes
  - Target, candidate relay nodes (RN)
- Pick the best to connect
  - If target is picked
    - Connect to target
  - If RN is picked
    - Connect to RN
    - RN connect to target

Polly @ NTU Copyright © 2008 19

## Candidate Relay Nodes (RN)

- Pre-defined and change dynamically
- Simply the candidate SNs in the host cache (HC)
- Probes can be a priori in low frequency
  - Shorten the delay in call establishment

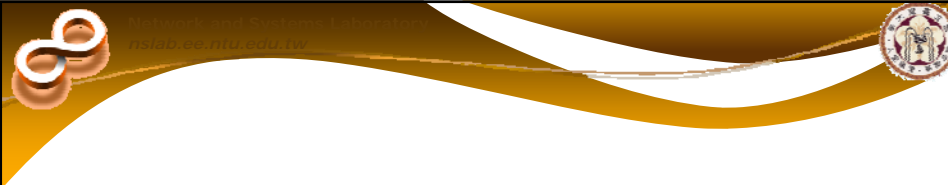

Polly @ NTU Copyright © 2008 20

# Who should be the relay peer?

such that the alternative path  
is **better** than the default  
one...

Polly @ NTU Copyright © 2008 21

# Skype's Solution

## Round-Trip Delay & Loss Rate (Probably)

[ICDCS 06] S. Ren, L. Guo, and X. Zhang, "ASAP: an AS-Aware Peer-relay protocol for high quality VoIP with low overhead", *Proceedings of the 26th International Conference on Distributed Computing Systems (ICDCS'06)*, Lisbon, Portugal, July 4-7, 2006

Polly @ NTU Copyright © 2008 22

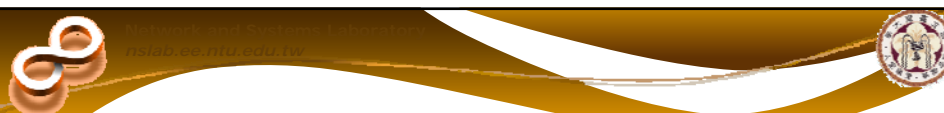

## A Fundamental Question

Which is the right path selection criteria?

Source Rate?  
 Congestion Level?  
 Delay?  
 Combination of the above?

Polly @ NTU Copyright © 2008 23

## User Satisfaction

$$\text{USI} = 2.15 * \log(\text{bit rate}) - 1.55 * \log(\text{jitter}) - 0.36 * \text{RTT}$$

bit rate: data rate of voice packets  
 jitter: level of network **congestion**  
 RTT: round-trip times between two parties

[SIGCOMM 06] Kuan-Ta Chen, Chun-Ying Huang, Polly Huang, Chin-Laung Lei, "Quantifying Skype User Satisfaction," *ACM SIGCOMM 2006*

Polly @ NTU Copyright © 2008 24

## Secret of Success

- Codec (provided by Global IP Sound)
  - 67 bytes packet payload
  - 24 to 120 kbps
- **NAT and firewall traversal**
- Alternative paths!

Polly @ NTU Copyright © 2008 25

## Special Ports

- Skype client listening on a randomly selected port
- If blocked by firewall, use
  - 80 -- HTTP
  - 443 -- HTTPS

Polly @ NTU Copyright © 2008 26

## TCP Connection

- Skype client listening using UDP
- If blocked by firewall, use
  - TCP

Polly @ NTU Copyright © 2008 27

## NAT Traversal

- STUN
  - Simple Traversal of UDP through NATs
  - **More details if time allows**
- TURN
  - Traversal Using Relay NAT
  - I.e., the relay node approach

Polly @ NTU Copyright © 2008 28

## Secret of Success

- **Codec** (provided by Global IP Sound)
  - 67 bytes packet payload
  - 10 to 120 kbps
- NAT and firewall traversal
- Alternative paths!

Polly @ NTU Copyright © 2008 29

## Codecs

- iLBC
  - 13.3 kbps (30 ms frames) 15.2 kbps (20 ms frames)
  - Better than G.729A and G.723.1
- iSAC
  - 10-120 kbps (**adaptive and variable**)
  - Wideband communication
- No silence suppression

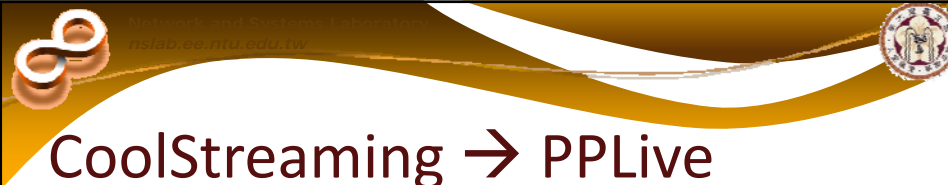

Polly @ NTU Copyright © 2008 30

# Multimedia P2P

Skype  
CoolStreaming  
HotStreaming

Polly @ NTU Copyright © 2008 31

# CoolStreaming → PPLive

- A peer-to-peer (P2P) overlay network for IPTV
- Hongkong-China based
- To an average user, it's free live sports event broadcast service
- 10,000s of subscribers

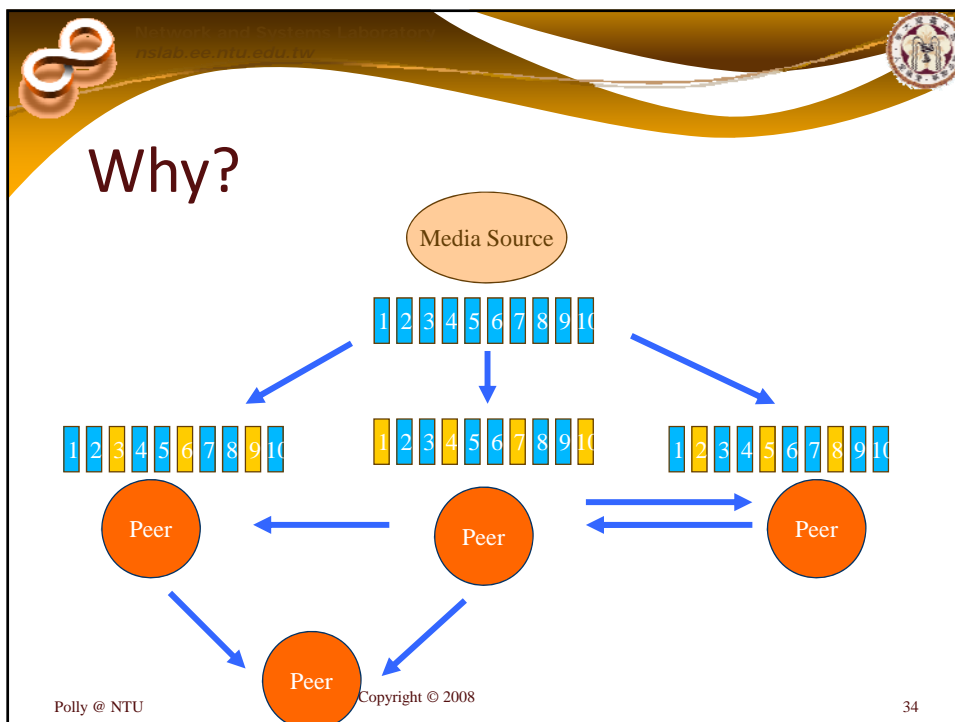

Polly @ NTU Copyright © 2008 32

## Secret of the CoolStreaming's Success

- Free content
- Smooth and quality video
- The more users, the better the quality

Polly @ NTU Copyright © 2008 33

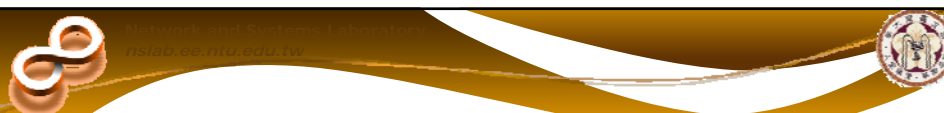

## Major Technical Components

	CoolStreaming
P2P Network Formation	Pure random
Frame Scheduling	Fewest copies first Dead-line oriented
Codec	Mpeg-4, windows WMA

Polly @ NTU Copyright © 2008 35

## Outline

- **Design of DONet**
- Performance Evaluation
- CoolStreaming
- Conclusion

Polly @ NTU Copyright © 2008 36

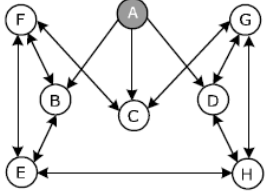

# DONet

(Data-driven Overlay Network)

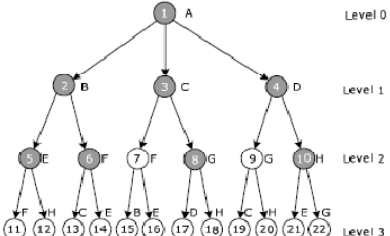

- Concept
  - Form a gossip P2P network
    - Essentially, a peer connect to other peers **randomly**
  - P2P network dynamically updated
    - Essentially, which peer connect to which peers is changed **periodically**
- Characteristics
  - Easy to implement
  - Robust and resilient
  - Efficient

Polly @ NTU Copyright © 2008 37

# P2P Network Topology

Mesh

As opposed to a tree

**The rest of the network can still function with a node fails!**

Polly @ NTU Copyright © 2008 38

## Network Comparison

	DONet	CoopNet
Base	mesh	tree
Load	balanced	unbalanced
Supplier/Client	not specified*	specified
Structure	distributed	centralized
Dynamic switch	robust	vulnerable

Polly @ NTU
Copyright © 2008
39

## Design of DONet

- 3 Key modules
  - Membership Manager
  - Partnership Manager
  - Buffer Map & Scheduler
- Terminology
  - Member → active nodes on t overlay network
  - Partner → nodes can exchange data (**a subset of members**)

```

graph TD
    Player[Player]
    subgraph DONet
        MM[Membership Manager]
        PM[Partnership Manager]
        BM[Buffer Map (BM)]
        S[Scheduler]
        NI[Network Interface]
    end
    subgraph Partners
        P1[Partner]
        P2[Partner]
        P3[Partner]
    end
    Player <--> MM
    Player <--> Buffer((Buffer))
    Buffer <--> BM
    Buffer <--> S
    MM <--> PM
    PM <--> NI
    S <--> NI
    NI <--> P1
    NI <--> P2
    NI <--> P3
  
```

Polly @ NTU
Copyright © 2008
40

# Membership Management

- SCAMP (Scalable Gossip Membership protocol)
- Join
  - A newly joined node contacts first a bootstrap node
    - Redirected to a deputy node
    - Randomly selected from the bootstrap node's mCache\*.
  - Deputy node gives the new node its mCache
- Maintain
  - **Periodical membership messages to update mCache**
  - Nodes will be removed from the list after a fixed amount of time

\*The membership cache contains a partial list of active nodes in DONet.

Polly @ NTU Copyright © 2008 41

# Implementation

Membership Relationship

Consuming Peer Providing Peer

1 can become a member of other nodes

2, 3, and 6 remain members of node 1

7, 8, and 9 are new members of node 1

Every peer:

1. Periodically send
2. An advertisement message (ADV)

Upon receiving the ADV:

1. Roll a dice
2. If win, select the ADV sender to provide video segments

Polly @ NTU Copyright © 2008 42

## Partnership Management

- Periodically establish new partnerships with nodes randomly selected from mCache
- Reject the lowest rating partner

Polly @ NTU Copyright © 2008 43

## Leave and Break Down

- Graceful leaving node should issue a departure message.
- Nodes discovering a partner failure\* also send departure messages.

\*Node failure can be detected after idle of the connection or BM exchange.

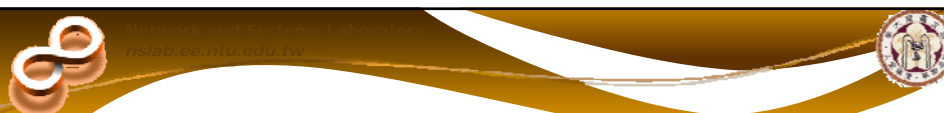

Polly @ NTU Copyright © 2008 44

## Buffer Map Management

- Buffer Map
  - Semi-synchronized playback progresses.
  - A **sliding window of 120 segments** can effectively represent the buffer map. Segments outside the window is ignored.
  - Use **120 bits** to record BM, with bit 1 indicating that a segment is available.
  - The **sequence number of the first segment** in the sliding window is record by another **2 bytes**.
- Each node continuously exchanges its BM with the partners.

Polly @ NTU Copyright © 2008 45

## Scheduling Algorithm

- Two constrains
  - Playback deadline for each segment
  - Heterogeneous streaming bandwidth
- Minimize segments missing deadlines.
- Heuristic algorithm
  - Calculate the number of the potential suppliers for each segments.
  - Less suppliers means higher risks of missing the deadlines.
  - Determine the supplier of each segment starting from the one with **lowest potential suppliers**.
  - Among the supplier candidates, pick the one **with higher BW** and enough available time.

Polly @ NTU Copyright © 2008 46

# Outline

- Design of DONet
- **Performance Evaluation**
- CoolStreaming
- Conclusion

Polly @ NTU Copyright © 2008 47

# Performance Evaluation\*

- Control overhead
  - Control traffic volume /Video traffic volume
- Continuity index
  - Number of segments that arrive in time over the total number of segments
- On/Off period
  - Average of node join/leave-period, which is exponentially distributed
- Stable Environment

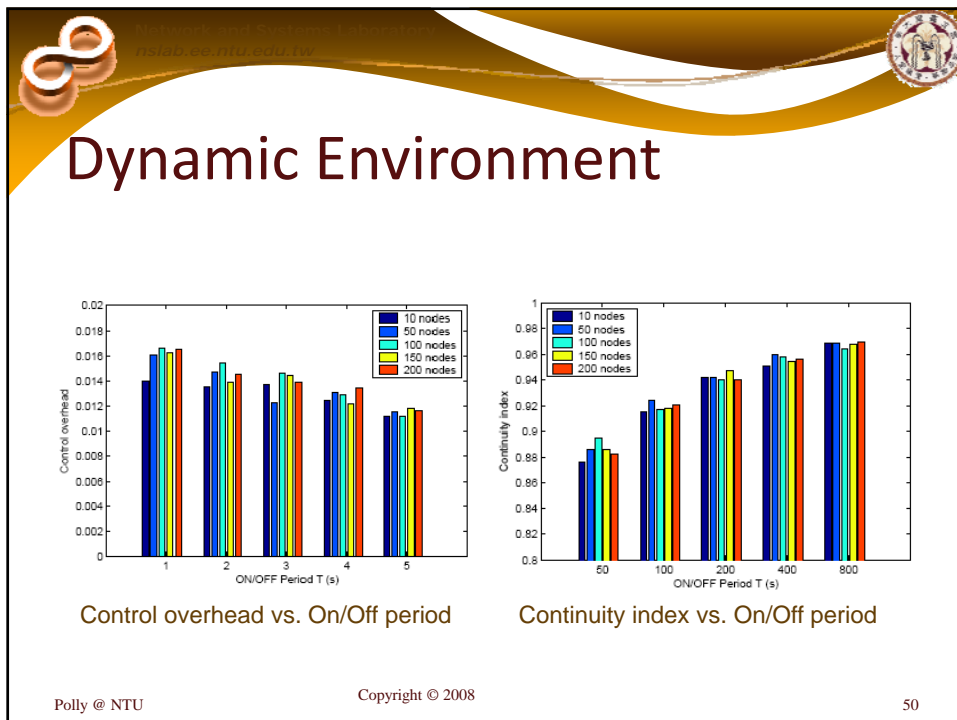

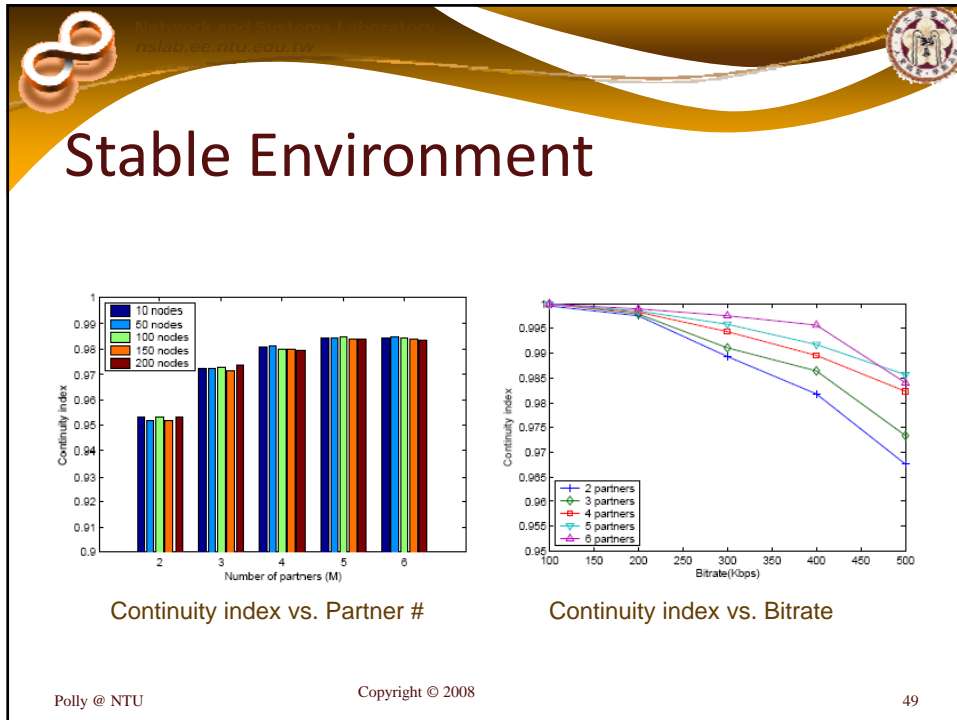

number of Partners (M)	10 nodes	50 nodes	100 nodes	150 nodes	200 nodes
2	0.006	0.006	0.006	0.006	0.006
3	0.009	0.009	0.009	0.009	0.009
4	0.012	0.012	0.012	0.012	0.012
5	0.014	0.014	0.014	0.014	0.014
6	0.017	0.017	0.017	0.017	0.017

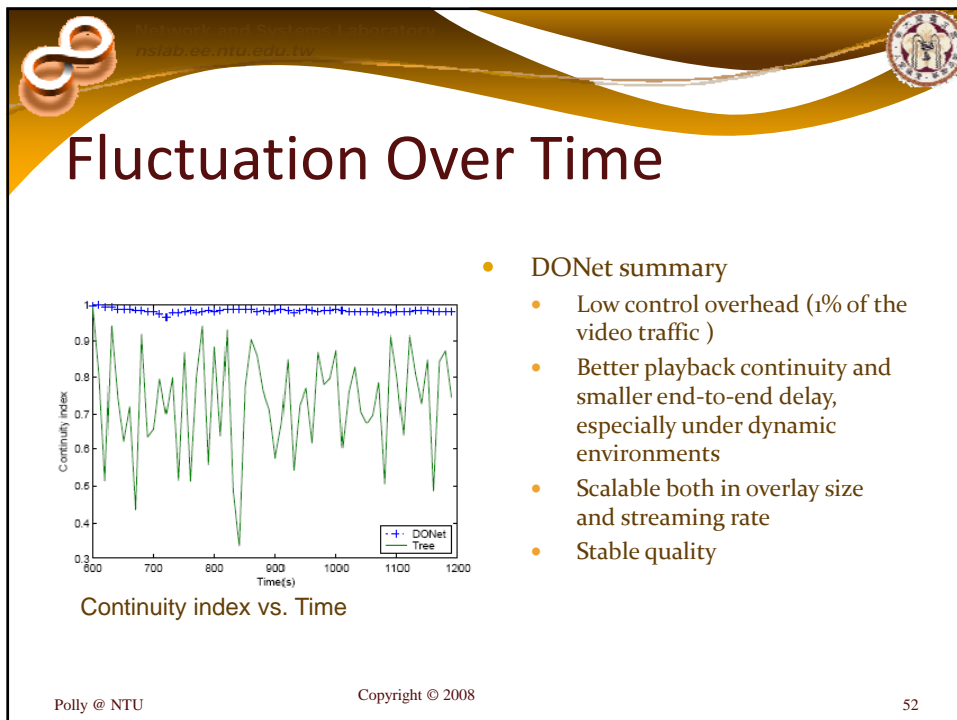

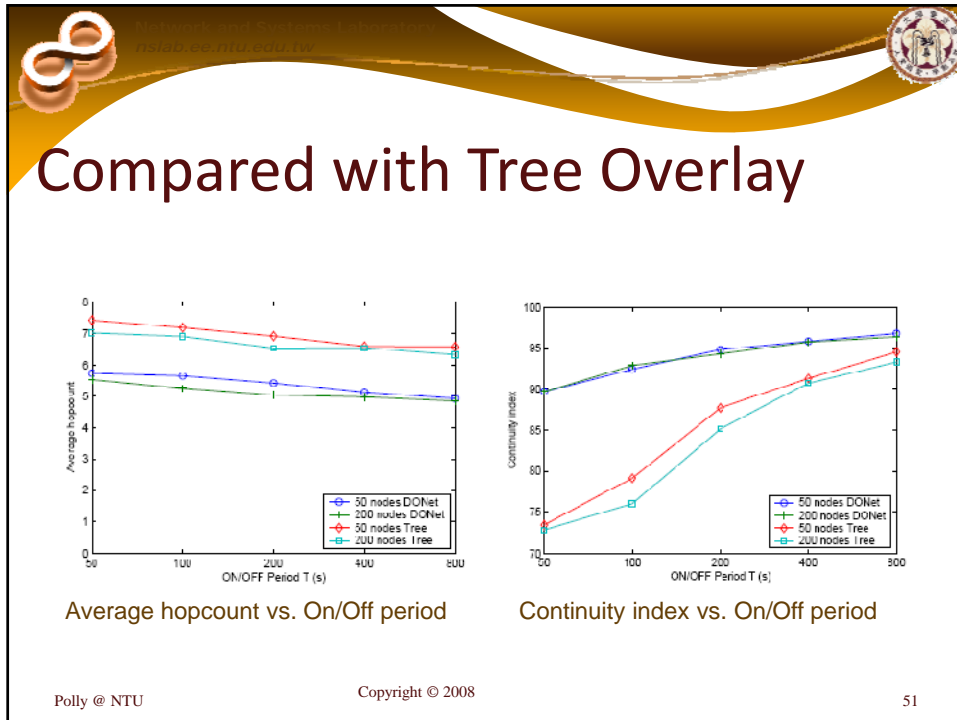

Control overhead vs. Partner #

\*Experiments are conducted in PlanetLab.

Polly @ NTU Copyright © 2008 48

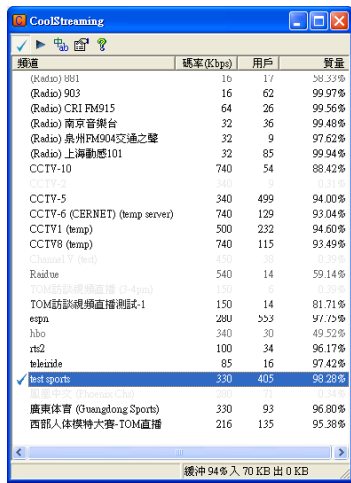

# CoolStreaming

- TFRC (TCP friendly rate control) protocol
- About 5~10 minutes to settle down the network

	ESPN	Test Sports	Channel V
Bitrate (kbps)	280	330	450
Online user	5000	2500	67
Server quality	95%	50~60%	75%
Buffer level	80%+	50%	90%
Video quality	good	poor	Mediocre

CoolStreaming v 0.0.42 released at March 1, 2005

Polly @ NTU Copyright © 2008 53

# Summary

- DONet is a **capacity amplifier** between a content provider and clients.
  - The larger the data-driven overlay is, the better the streaming quality it delivers.
- DONet doesn't maintain an explicit overlay structure
  - A mesh-based overlay network
  - Scalable and robust
- The problem of user behind Firewall can be solved by TCP connection.
  - Statistical results show that more than 95% of the nodes can become relay nodes.

Polly @ NTU Copyright © 2008 54

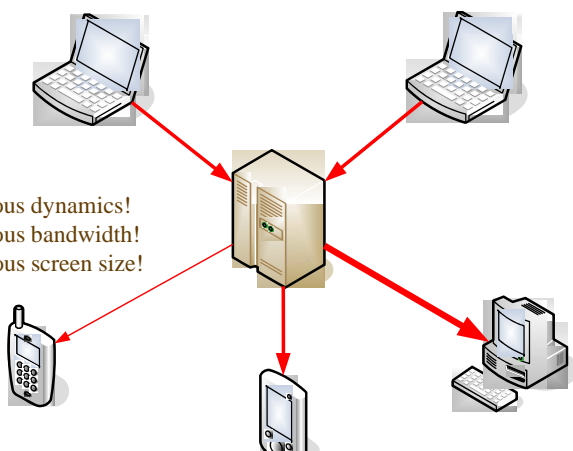

# Multimedia P2P

Skype  
CoolStreaming  
**HotStreaming**

Polly @ NTU Copyright © 2008 55

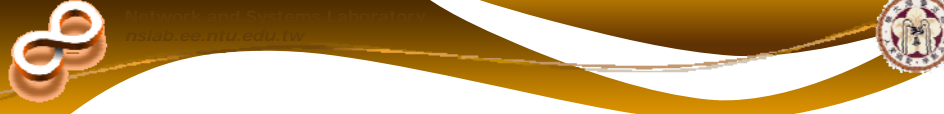

# Mobile IPTV

Heterogeneous dynamics!  
Heterogeneous bandwidth!  
Heterogeneous screen size!

Polly @ NTU Copyright © 2008 56

## Differences

	CoolStreaming	HotStreaming
Partnership Formation	Pure random	Preferential random (rotate)
Frame Request Scheduling	Heuristic: (fewest copies first Earliest Deadline first)	Optimal: (min loss under bw constraint)
Codec	Mpeg-4, windows WMA	Mpeg-4, interleaving MDC (bw heterogeneity)

Polly @ NTU Copyright © 2008 57

## System Advantages

	HotStreaming	Advantages
Partnership Formation	Preferential random (rotate)	Stability
Frame Request Scheduling	Optimal: (min loss under bw constraint)	Minimum loss
Codec	Mpeg-4, interleaving MDC (bw heterogeneity)	Sustainable quality for heterogeneous users

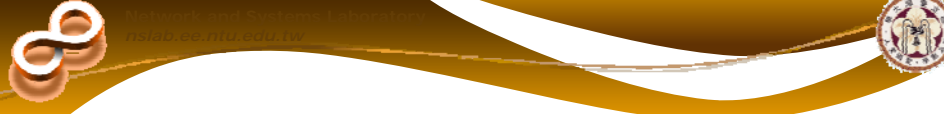

Polly @ NTU Copyright © 2008 58

# Three Components

- Partnership formation
- Multiple description coding
- Video segment scheduling

Polly @ NTU Copyright © 2008 59

## Qualitative Comparison

- SCAMP
  - Forwarding of ADV
    - To all partners
  - Selection of partner
    - Depending on current #partners
- TYPHOON
  - Forwarding of ADV
    - To partners who have few partners
    - To avoid peers being isolated → better stability
  - Selection of partner
    - Depending on current #partners
    - Bounded by the max #partners → better load balance

Polly @ NTU Copyright © 2008 61

## Quantitative Comparison

	SCAMP	TYPHOON
Connected Time (sec)	59180	74320
Disconnected Time (sec)	15820	680
Disconnected Node (N)	305	18
Instability Index	51700	2580

**Stability Improvement ~ 20 fold**

Polly @ NTU Copyright © 2008 62

# MDC: Idea

MDC-STHI:  
MDC with Spatial-Temopral Hybrid Interpolation

Adding Redundant Quarter-Sized Streams

Polly @ NTU Copyright © 2008 63

# Very Key to Mobile IPTV

$E_f$ : Full size even frame  
 $E_q$ : 1/4 size even frame  
 $O_f$ : Full size odd frame  
 $O_q$ : 1/4 size odd frame

N1  $E_f + O_q$  N2  $O_f + E_q$   
 N3  $E_q + O_q$   $E_f + O_f + E_q + O_q$   
 N4  $E_f + O_q$  N5  $E_f + O_q$  N6

Polly @ NTU Copyright © 2008 64

Polly @ NTU

65

## Segment Request Scheduling

- From a peer's partners
  - Available segment type (e.g.  $E_p$ ,  $O_q$ ) and size
- The peer calculates
  - Maximize the video quality
    - Score of full-sized segments > quarter-sized ones
  - Under 2 constraints
    - Estimated time for segment to arrive < playback time
    - Total segments to request < estimated available bandwidth
- A linear programming problem
  - Efficient approximation algorithm
  - Computation < 10s milliseconds

Copyright © 2008

Polly @ NTU

66

## Segment Request: Illustrated

2:  $\{E_f(1), O_f(1), \dots\}$

3:  $\{O_f(1), E_f(1), \dots\}$

6:  $\{O_q(2), E_q(2), \dots\}$

**Variables**  
 $x_i^j$ : a schedule that requires MDC type  $j$  for segment  $i$

**Maximize**  

$$\sum_{i=1}^K \sum_{j=1}^L x_i^j U_i^j$$

**Subject to**

$$T_i = T_{i-1} + 1 - \sum_{j=1}^L \frac{S_i^j}{B} x_i^j > 0, 1 \leq i \leq K$$

$$0 \leq \sum_{j=1}^L x_i^j \leq 1, 1 \leq i \leq K$$

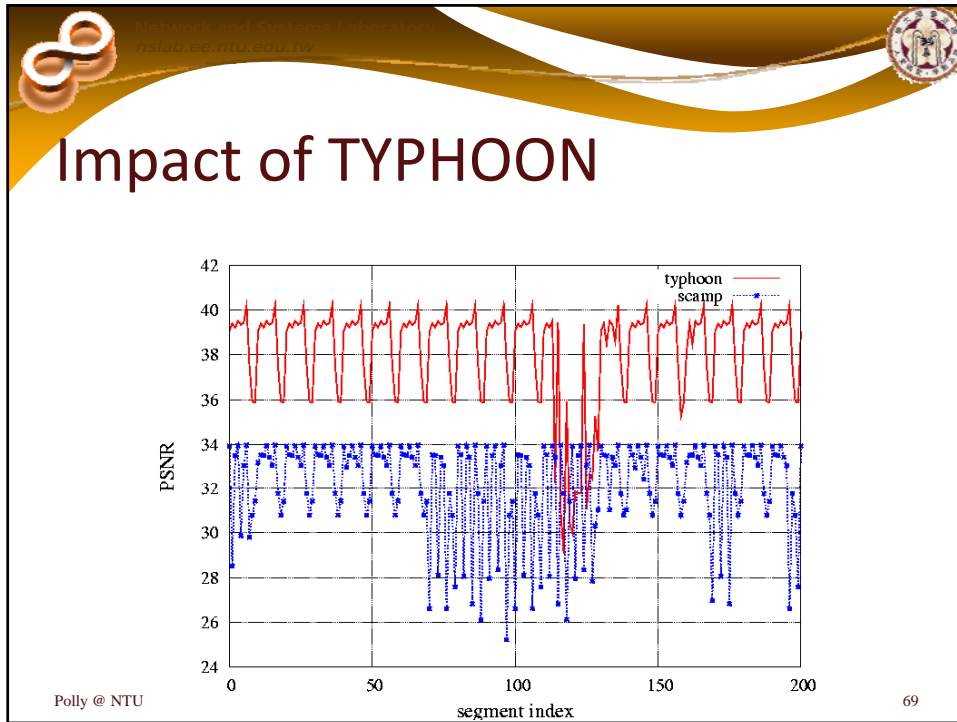

$$x_i^j \in \{0,1\}, 0 \leq x_i^j \leq 1, 1 \leq i \leq K, 1 \leq j \leq L$$

Polly @ NTU
Copyright © 2008
67

## Testbed Experiments

- All three components integrated

Polly @ NTU
68

## Summary

	HotStreaming	Advantages
Partnership Formation	Preferential random (rotate)	Stability
Frame Request Scheduling	Optimal: (min loss under bw constraint)	Minimum loss
Codec	Mpeg-4, interleaving MDC (bw heterogeneity)	Sustainable quality for heterogeneous users

Polly @ NTU Copyright © 2008 71

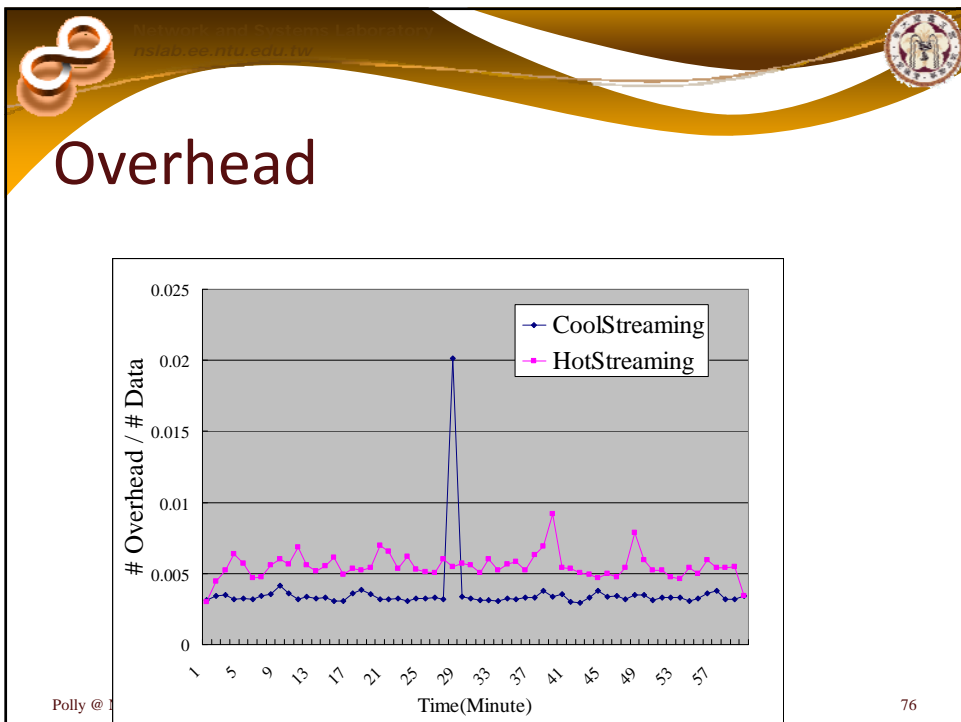

## PlanetLab Results

- Small-scale testing on Campus Network
  - 15-node scale testing
  - 1 server, 14 peer users
  - 1 Mbps video source for an hour
- Network centric measurement
  - Scalability
  - Packet loss rate (arrival rate within deadline)
  - Control message overhead

Polly @ NTU Copyright © 2008 72

# Questions?

Polly @ NTU

Copyright © 2008

77
